Contents:

1.1 Challenges

Internal class delegating to a module, and displaying warnings when attributes related to TLS-SNI-01 are accessed.

```
class acme.challenges.Challenge (**kwargs)
    Bases: josepy.json_util.TypedJSONObjectWithFields
    ACME challenge.

    classmethod from_json (obj)
        Deserialize ACME object from valid JSON object.

        Raises josepy.errors.UnrecognizedTypeError – if type of the ACME object has
            not been registered.

class acme.challenges.ChallengeResponse (**kwargs)
    Bases: josepy.json_util.TypedJSONObjectWithFields
    ACME challenge response.

class acme.challenges.DNS (**kwargs)
    Bases: acme.challenges._TokenChallenge
    ACME “dns” challenge.

LABEL = '_acme-challenge'
    Label clients prepend to the domain name being validated.

gen_validation (account_key, alg=RS256, **kwargs)
    Generate validation.

    Parameters
    • account_key (JWK) – Private account key.
    • alg (JWA) –

    Returns This challenge wrapped in JWS
```

Return type JWS

check_validation (*validation*, *account_public_key*)
Check validation.

Parameters

- **validation** (*JWS*) –
- **account_public_key** (*JWK*) –

Return type bool

gen_response (*account_key*, ***kwargs*)
Generate response.

Parameters

- **account_key** (*JWK*) – Private account key.
- **alg** (*JWA*) –

Return type *DNSResponse*

validation_domain_name (*name*)
Domain name for TXT validation record.

Parameters **name** (*unicode*) – Domain name being validated.

class `acme.challenges.DNS01` (***kwargs*)
Bases: `acme.challenges.KeyAuthorizationChallenge`
ACME dns-01 challenge.

response_cls
alias of `DNS01Response`

LABEL = `'_acme-challenge'`
Label clients prepend to the domain name being validated.

validation (*account_key*, ***unused_kwargs*)
Generate validation.

Parameters **account_key** (*JWK*) –

Return type unicode

validation_domain_name (*name*)
Domain name for TXT validation record.

Parameters **name** (*unicode*) – Domain name being validated.

class `acme.challenges.DNS01Response` (***kwargs*)
Bases: `acme.challenges.KeyAuthorizationChallengeResponse`
ACME dns-01 challenge response.

simple_verify (*chall*, *domain*, *account_public_key*)
Simple verify.

This method no longer checks DNS records and is a simple wrapper around `KeyAuthorizationChallengeResponse.verify`.

Parameters

- **chall** (`challenges.DNS01`) – Corresponding challenge.
- **domain** (*unicode*) – Domain name being verified.

- **account_public_key** (*JWK*) – Public key for the key pair being authorized.

Returns True iff verification of the key authorization was successful.

Return type bool

class `acme.challenges.DNSResponse` (***kwargs*)

Bases: `acme.challenges.ChallengeResponse`

ACME “dns” challenge response.

Parameters **validation** (*JWS*) –

check_validation (*chall, account_public_key*)

Check validation.

Parameters

- **chall** (`challenges.DNS`) –
- **account_public_key** (*JWK*) –

Return type bool

class `acme.challenges.HTTP01` (***kwargs*)

Bases: `acme.challenges.KeyAuthorizationChallenge`

ACME http-01 challenge.

response_cls

alias of `HTTP01Response`

URI_ROOT_PATH = `'well-known/acme-challenge'`

URI root path for the server provisioned resource.

path

Path (starting with '/') for provisioned resource.

Return type string

uri (*domain*)

Create an URI to the provisioned resource.

Forms an URI to the HTTPS server provisioned resource (containing token).

Parameters **domain** (*unicode*) – Domain name being verified.

Return type string

validation (*account_key, **unused_kwargs*)

Generate validation.

Parameters **account_key** (*JWK*) –

Return type unicode

class `acme.challenges.HTTP01Response` (***kwargs*)

Bases: `acme.challenges.KeyAuthorizationChallengeResponse`

ACME http-01 challenge response.

PORT = `80`

Verification port as defined by the protocol.

You can override it (e.g. for testing) by passing `port` to `simple_verify`.

WHITESPACE_CUTSET = `'\n\r\t '`

Whitespace characters which should be ignored at the end of the body.

simple_verify (*chall, domain, account_public_key, port=None*)

Simple verify.

Parameters

- **chall** (*challenges.SimpleHTTP*) – Corresponding challenge.
- **domain** (*unicode*) – Domain name being verified.
- **account_public_key** (*JWK*) – Public key for the key pair being authorized.
- **port** (*int*) – Port used in the validation.

Returns `True` iff validation with the files currently served by the HTTP server is successful.

Return type `bool`

class `acme.challenges.KeyAuthorizationChallenge` (***kwargs*)

Bases: `acme.challenges._TokenChallenge`

Challenge based on Key Authorization.

Parameters

- **response_cls** – Subclass of `KeyAuthorizationChallengeResponse` that will be used to generate *response*.
- **typ** (*str*) – type of the challenge

key_authorization (*account_key*)

Generate Key Authorization.

Parameters **account_key** (*JWK*) –

Rtype `unicode`

response (*account_key*)

Generate response to the challenge.

Parameters **account_key** (*JWK*) –

Returns Response (initialized *response_cls*) to the challenge.

Return type `KeyAuthorizationChallengeResponse`

validation (*account_key, **kwargs*)

Generate validation for the challenge.

Subclasses must implement this method, but they are likely to return completely different data structures, depending on what's necessary to complete the challenge. Interpretation of that return value must be known to the caller.

Parameters **account_key** (*JWK*) –

Returns Challenge-specific validation.

response_and_validation (*account_key, *args, **kwargs*)

Generate response and validation.

Convenience function that return results of *response* and *validation*.

Parameters **account_key** (*JWK*) –

Return type `tuple`

class `acme.challenges.KeyAuthorizationChallengeResponse` (***kwargs*)

Bases: `acme.challenges.ChallengeResponse`

Response to Challenges based on Key Authorization.

Parameters `key_authorization` (*unicode*) –

verify (*chall*, *account_public_key*)

Verify the key authorization.

Parameters

- **chall** (*KeyAuthorization*) – Challenge that corresponds to this response.
- **account_public_key** (*JWK*) –

Returns `True` iff verification of the key authorization was successful.

Return type `bool`

to_partial_json ()

Get JSON serializable object.

Returns Serializable JSON object representing ACME typed object. `validate()` will almost certainly not work, due to reasons explained in `josepy.interfaces.IJSONSerializable`.

Return type `dict`

class `acme.challenges.TLSALPN01` (**kwargs)

Bases: `acme.challenges.KeyAuthorizationChallenge`

ACME tls-alpn-01 challenge.

This class simply allows parsing the TLS-ALPN-01 challenge returned from the CA. Full TLS-ALPN-01 support is not currently provided.

response_cls

alias of `TLSALPN01Response`

validation (*account_key*, **kwargs)

Generate validation for the challenge.

class `acme.challenges.TLSALPN01Response` (**kwargs)

Bases: `acme.challenges.KeyAuthorizationChallengeResponse`

ACME TLS-ALPN-01 challenge response.

This class only allows initiating a TLS-ALPN-01 challenge returned from the CA. Full support for responding to TLS-ALPN-01 challenges by generating and serving the expected response certificate is not currently provided.

class `acme.challenges.TLSSNI01` (**kwargs)

Bases: `acme.challenges.KeyAuthorizationChallenge`

ACME tls-sni-01 challenge.

response_cls

alias of `TLSSNI01Response`

validation (*account_key*, **kwargs)

Generate validation.

Parameters

- **account_key** (*JWK*) –
- **cert_key** (*OpenSSL.crypto.PKey*) – Optional private key used in certificate generation. If not provided (`None`), then fresh key will be generated.

Return type `tuple` of `OpenSSL.crypto.X509` and `OpenSSL.crypto.PKey`

```
class acme.challenges.TLSSNI01Response (**kwargs)
    Bases: acme.challenges.KeyAuthorizationChallengeResponse

    ACME tls-sni-01 challenge response.

    DOMAIN_SUFFIX = '.acme.invalid'
        Domain name suffix.

    PORT = 443
        Verification port as defined by the protocol.

        You can override it (e.g. for testing) by passing port to simple_verify.

z
    z value used for verification.

    Rtype bytes

z_domain
    Domain name used for verification, generated from z.

    Rtype bytes

gen_cert (key=None, bits=2048)
    Generate tls-sni-01 certificate.

    Parameters

    • key (OpenSSL.crypto.PKey) – Optional private key used in certificate generation.
      If not provided (None), then fresh key will be generated.

    • bits (int) – Number of bits for newly generated key.

    Return type tuple of OpenSSL.crypto.X509 and OpenSSL.crypto.PKey

probe_cert (domain, **kwargs)
    Probe tls-sni-01 challenge certificate.

    Parameters domain (unicode) –

verify_cert (cert)
    Verify tls-sni-01 challenge certificate.

    Parameters cert (OpenSSL.crypto.X509) – Challenge certificate.

    Returns Whether the certificate was successfully verified.

    Return type bool

simple_verify (chall, domain, account_public_key, cert=None, **kwargs)
    Simple verify.

    Verify validation using account_public_key, optionally probe tls-sni-01 certificate and check
    using verify_cert.

    Parameters

    • chall (challenges.TLSSNI01) – Corresponding challenge.

    • domain (str) – Domain name being validated.

    • account_public_key (JWK) –

    • cert (OpenSSL.crypto.X509) – Optional certificate. If not provided (None) cer-
      tificate will be retrieved using probe_cert.

    • port (int) – Port used to probe the certificate.
```

Returns True iff client’s control of the domain has been verified.

Return type bool

class `acme.challenges.UnrecognizedChallenge` (*jobj*)

Bases: `acme.challenges.Challenge`

Unrecognized challenge.

ACME specification defines a generic framework for challenges and defines some standard challenges that are implemented in this module. However, other implementations (including peers) might define additional challenge types, which should be ignored if unrecognized.

Variables `jobj` – Original JSON decoded object.

to_partial_json ()

Get JSON serializable object.

Returns Serializable JSON object representing ACME typed object. `validate()` will almost certainly not work, due to reasons explained in `josepy.interfaces.IJSONSerializable`.

Return type dict

classmethod `from_json` (*jobj*)

Deserialize ACME object from valid JSON object.

Raises `josepy.errors.UnrecognizedTypeError` – if type of the ACME object has not been registered.

class `acme.challenges._TokenChallenge` (***kwargs*)

Bases: `acme.challenges.Challenge`

Challenge with token.

Variables `token` (*bytes*) –

TOKEN_SIZE = 16

Minimum size of the token in bytes.

good_token

Is `token` good?

Todo: acme-spec wants “It MUST NOT contain any non-ASCII characters”, but it should also warrant that it doesn’t contain “.” or “/”...

1.2 Client

ACME client API.

class `acme.client.ClientBase` (*directory, net, acme_version*)

Bases: `object`

ACME client base object.

Variables

- **directory** (`messages.Directory`) –
- **net** (`ClientNetwork`) – Client network.

- **acme_version** (*int*) – ACME protocol version. 1 or 2.

_post (**args, **kwargs*)

Wrapper around `self.net.post` that adds the `acme_version`.

update_registration (*regr, update=None*)

Update registration.

Parameters

- **regr** (`messages.RegistrationResource`) – Registration Resource.
- **update** (`messages.Registration`) – Updated body of the resource. If not provided, body will be taken from `regr`.

Returns Updated Registration Resource.

Return type `RegistrationResource`

deactivate_registration (*regr*)

Deactivate registration.

Parameters **regr** (`messages.RegistrationResource`) – The Registration Resource to be deactivated.

Returns The Registration resource that was deactivated.

Return type `RegistrationResource`

answer_challenge (*challb, response*)

Answer challenge.

Parameters

- **challb** (`ChallengeBody`) – Challenge Resource body.
- **response** (`challenges.ChallengeResponse`) – Corresponding Challenge response

Returns Challenge Resource with updated body.

Return type `ChallengeResource`

Raises `UnexpectedUpdate` –

classmethod **retry_after** (*response, default*)

Compute next poll time based on response `Retry-After` header.

Handles integers and various datestring formats per <https://www.w3.org/Protocols/rfc2616/rfc2616-sec14.html#sec14.37>

Parameters

- **response** (`requests.Response`) – Response from poll.
- **default** (*int*) – Default value (in seconds), used when `Retry-After` header is not present or invalid.

Returns Time point when next poll should be performed.

Return type `datetime.datetime`

_revoke (*cert, rsn, url*)

Revoke certificate.

Parameters

- **cert** (*ComparableX509*) – OpenSSL.crypto.X509 wrapped in ComparableX509
- **rsn** (*int*) – Reason code for certificate revocation.
- **url** (*str*) – ACME URL to post to

Raises *ClientError* – If revocation is unsuccessful.

class `acme.client.Client` (*directory, key, alg=RS256, verify_ssl=True, net=None*)

Bases: `acme.client.ClientBase`

ACME client for a v1 API.

Todo: Clean up raised error types hierarchy, document, and handle (wrap) instances of `DeserializationError` raised in `from_json()`.

Variables

- **directory** (`messages.Directory`) –
- **key** – `josepy.JWK` (private)
- **alg** – `josepy.JWASignature`
- **verify_ssl** (*bool*) – Verify SSL certificates?
- **net** (`ClientNetwork`) – Client network. Useful for testing. If not supplied, it will be initialized using `key, alg` and `verify_ssl`.

register (*new_reg=None*)

Register.

Parameters `new_reg` (`NewRegistration`) –

Returns Registration Resource.

Return type `RegistrationResource`

query_registration (*reg*)

Query server about registration.

Parameters `messages.RegistrationResource` – Existing Registration Resource.

agree_to_tos (*reg*)

Agree to the terms-of-service.

Agree to the terms-of-service in a Registration Resource.

Parameters `reg` (`RegistrationResource`) – Registration Resource.

Returns Updated Registration Resource.

Return type `RegistrationResource`

request_challenges (*identifier, new_authzr_uri=None*)

Request challenges.

Parameters

- **identifier** (`messages.Identifier`) – Identifier to be challenged.
- **new_authzr_uri** (*str*) – Deprecated. Do not use.

Returns Authorization Resource.

Return type *AuthorizationResource*

Raises *errors.WildcardUnsupportedError* – if a wildcard is requested

request_domain_challenges (*domain, new_authzr_uri=None*)

Request challenges for domain names.

This is simply a convenience function that wraps around *request_challenges*, but works with domain names instead of generic identifiers. See *request_challenges* for more documentation.

Parameters

- **domain** (*str*) – Domain name to be challenged.
- **new_authzr_uri** (*str*) – Deprecated. Do not use.

Returns Authorization Resource.

Return type *AuthorizationResource*

Raises *errors.WildcardUnsupportedError* – if a wildcard is requested

request_issuance (*csr, authzrs*)

Request issuance.

Parameters

- **csr** (*OpenSSL.crypto.X509Req* wrapped in *ComparableX509*) – CSR
- **authzrs** – list of *AuthorizationResource*

Returns Issued certificate

Return type *messages.CertificateResource*

poll (*authzr*)

Poll Authorization Resource for status.

Parameters **authzr** (*AuthorizationResource*) – Authorization Resource

Returns Updated Authorization Resource and HTTP response.

Return type (*AuthorizationResource, requests.Response*)

poll_and_request_issuance (*csr, authzrs, mintime=5, max_attempts=10*)

Poll and request issuance.

This function polls all provided Authorization Resource URIs until all challenges are valid, respecting *Retry-After* HTTP headers, and then calls *request_issuance*.

Parameters

- **csr** (*ComparableX509*) – CSR (*OpenSSL.crypto.X509Req* wrapped in *ComparableX509*)
- **authzrs** – list of *AuthorizationResource*
- **mintime** (*int*) – Minimum time before next attempt, used if *Retry-After* is not present in the response.
- **max_attempts** (*int*) – Maximum number of attempts (per authorization) before *PollError* with non-empty waiting is raised.

Returns (*cert, updated_authzrs*) tuple where *cert* is the issued certificate (*messages.CertificateResource*), and *updated_authzrs* is a tuple consisting of updated Authorization Resources (*AuthorizationResource*) as present in the responses from server, and in the same order as the input *authzrs*.

Return type `tuple`

Raises `PollError` – in case of timeout or if some authorization was marked by the CA as invalid

`_get_cert` (*uri*)

Returns certificate from URI.

Parameters `uri` (*str*) – URI of certificate

Returns tuple of the form (response, `josepy.util.ComparableX509`)

Return type `tuple`

`check_cert` (*certr*)

Check for new cert.

Parameters `certr` (`CertificateResource`) – Certificate Resource

Returns Updated Certificate Resource.

Return type `CertificateResource`

`refresh` (*certr*)

Refresh certificate.

Parameters `certr` (`CertificateResource`) – Certificate Resource

Returns Updated Certificate Resource.

Return type `CertificateResource`

`fetch_chain` (*certr, max_length=10*)

Fetch chain for certificate.

Parameters

- `certr` (`CertificateResource`) – Certificate Resource
- `max_length` (*int*) – Maximum allowed length of the chain. Note that each element in the certificate requires new HTTP GET request, and the length of the chain is controlled by the ACME CA.

Raises `errors.Error` – if recursion exceeds `max_length`

Returns Certificate chain for the Certificate Resource. It is a list ordered so that the first element is a signer of the certificate from Certificate Resource. Will be empty if `cert_chain_uri` is None.

Return type `list` of `OpenSSL.crypto.X509` wrapped in `ComparableX509`

`revoke` (*cert, rsu*)

Revoke certificate.

Parameters

- `cert` (`ComparableX509`) – `OpenSSL.crypto.X509` wrapped in `ComparableX509`
- `rsu` (*int*) – Reason code for certificate revocation.

Raises `ClientError` – If revocation is unsuccessful.

class `acme.client.ClientV2` (*directory, net*)

Bases: `acme.client.ClientBase`

ACME client for a v2 API.

Variables

- **directory** (`messages.Directory`) –
- **net** (`ClientNetwork`) – Client network.

new_account (*new_account*)

Register.

Parameters **new_account** (`NewRegistration`) –**Raises** `ConflictError` – in case the account already exists**Returns** Registration Resource.**Return type** `RegistrationResource`**query_registration** (*regr*)

Query server about registration.

Parameters **messages.RegistrationResource** – Existing Registration Resource.**update_registration** (*regr, update=None*)

Update registration.

Parameters

- **regr** (`messages.RegistrationResource`) – Registration Resource.
- **update** (`messages.Registration`) – Updated body of the resource. If not provided, body will be taken from `regr`.

Returns Updated Registration Resource.**Return type** `RegistrationResource`**new_order** (*csr_pem*)

Request a new Order object from the server.

Parameters **csr_pem** (*str*) – A CSR in PEM format.**Returns** The newly created order.**Return type** `OrderResource`**poll** (*authzr*)

Poll Authorization Resource for status.

Parameters **authzr** (`AuthorizationResource`) – Authorization Resource**Returns** Updated Authorization Resource and HTTP response.**Return type** (`AuthorizationResource, requests.Response`)**poll_and_finalize** (*orderr, deadline=None*)

Poll authorizations and finalize the order.

If no deadline is provided, this method will timeout after 90 seconds.

Parameters

- **orderr** (`messages.OrderResource`) – order to finalize
- **deadline** (`datetime.datetime`) – when to stop polling and timeout

Returns finalized order**Return type** `messages.OrderResource`

poll_authorizations (*orderr*, *deadline*)

Poll Order Resource for status.

finalize_order (*orderr*, *deadline*)

Finalize an order and obtain a certificate.

Parameters

- **orderr** (*messages.OrderResource*) – order to finalize
- **deadline** (*datetime.datetime*) – when to stop polling and timeout

Returns finalized order

Return type *messages.OrderResource*

revoke (*cert*, *rsn*)

Revoke certificate.

Parameters

- **cert** (*ComparableX509*) – OpenSSL.crypto.X509 wrapped in ComparableX509
- **rsn** (*int*) – Reason code for certificate revocation.

Raises *ClientError* – If revocation is unsuccessful.

external_account_required ()

Checks if ACME server requires External Account Binding authentication.

_post_as_get (**args*, ***kwargs*)

Send GET request using the POST-as-GET protocol if needed. The request will be first issued using POST-as-GET for ACME v2. If the ACME CA servers do not support this yet and return an error, request will be retried using GET. For ACME v1, only GET request will be tried, as POST-as-GET is not supported.
:param args: :param kwargs: :return:

class `acme.client.BackwardsCompatibleClientV2` (*net*, *key*, *server*)

Bases: `object`

ACME client wrapper that tends towards V2-style calls, but supports V1 servers.

Note: While this class handles the majority of the differences between versions of the ACME protocol, if you need to support an ACME server based on version 3 or older of the IETF ACME draft that uses combinations in authorizations (or lack thereof) to signal that the client needs to complete something other than any single challenge in the authorization to make it valid, the user of this class needs to understand and handle these differences themselves. This does not apply to either of Let's Encrypt's endpoints where successfully completing any challenge in an authorization will make it valid.

Variables

- **acme_version** (*int*) – 1 or 2, corresponding to the Let's Encrypt endpoint
- **client** (*ClientBase*) – either `Client` or `ClientV2`

new_account_and_tos (*regr*, *check_tos_cb=None*)

Combined register and agree_tos for V1, new_account for V2

Parameters

- **regr** (*NewRegistration*) –

- **check_tos_cb** (*callable*) – callback that raises an error if the check does not work

new_order (*csr_pem*)

Request a new Order object from the server.

If using ACMEv1, returns a dummy OrderResource with only the authorizations field filled in.

Parameters **csr_pem** (*str*) – A CSR in PEM format.

Returns The newly created order.

Return type *OrderResource*

Raises *errors.WildcardUnsupportedError* – if a wildcard domain is requested but unsupported by the ACME version

finalize_order (*orderr, deadline*)

Finalize an order and obtain a certificate.

Parameters

- **orderr** (*messages.OrderResource*) – order to finalize
- **deadline** (*datetime.datetime*) – when to stop polling and timeout

Returns finalized order

Return type *messages.OrderResource*

revoke (*cert, rsn*)

Revoke certificate.

Parameters

- **cert** (*ComparableX509*) – OpenSSL.crypto.X509 wrapped in ComparableX509
- **rsn** (*int*) – Reason code for certificate revocation.

Raises *ClientError* – If revocation is unsuccessful.

external_account_required ()

Checks if the server requires an external account for ACMEv2 servers.

Always return False for ACMEv1 servers, as it doesn't use External Account Binding.

```
class acme.client.ClientNetwork (key, account=None, alg=RS256, verify_ssl=True,  
                                user_agent='acme-python', timeout=45,  
                                source_address=None)
```

Bases: *object*

Wrapper around requests that signs POSTs for authentication.

Also adds user agent, and handles Content-Type.

REPLAY_NONCE_HEADER = 'Replay-Nonce'

Initialize.

Parameters

- **key** (*josepy.JWK*) – Account private key
- **account** (*messages.RegistrationResource*) – Account object. Required if you are planning to use `.post()` with `acme_version=2` for anything other than creating a new account; may be set later after registering.
- **alg** (*josepy.JWASignature*) – Algorithm to use in signing JWS.

- **verify_ssl** (*bool*) – Whether to verify certificates on SSL connections.
- **user_agent** (*str*) – String to send as User-Agent header.
- **timeout** (*float*) – Timeout for requests.
- **source_address** (*str or tuple(str, int)*) – Optional source address to bind to when making requests.

`_wrap_in_jws` (*obj, nonce, url, acme_version*)
Wrap JSONDeSerializable object in JWS.

Todo: Implement `acmePath`.

Parameters

- **obj** (*josepy.JSONDeSerializable*) –
- **url** (*str*) – The URL to which this object will be POSTed
- **nonce** (*bytes*) –

Return type `josepy.JWS`

classmethod `_check_response` (*response, content_type=None*)
Check response content and its type.

Note: Checking is not strict: wrong server response `Content-Type` HTTP header is ignored if response is an expected JSON object (c.f. Boulder #56).

Parameters `content_type` (*str*) – Expected Content-Type response header. If JSON is expected and not present in server response, this function will raise an error. Otherwise, wrong Content-Type is ignored, but logged.

Raises

- **`messages.Error`** – If server response body carries HTTP Problem (draft-ietf-appsawg-http-problem-00).
- **`ClientError`** – In case of other networking errors.

`_send_request` (*method, url, *args, **kwargs*)
Send HTTP request.

Makes sure that `verify_ssl` is respected. Logs request and response (with headers). For allowed parameters please see `requests.request`.

Parameters

- **method** (*str*) – method for the new `requests.Request` object
- **url** (*str*) – URL for the new `requests.Request` object

Raises `requests.exceptions.RequestException` – in case of any problems

Returns HTTP Response

Return type `requests.Response`

head (*args, **kwargs)

Send HEAD request without checking the response.

Note, that `_check_response` is not called, as it is expected that status code other than successfully 2xx will be returned, or `messages2.Error` will be raised by the server.

get (url, content_type='application/json', **kwargs)

Send GET request and check response.

post (*args, **kwargs)

POST object wrapped in `JWS` and check response.

If the server responded with a `badNonce` error, the request will be retried once.

1.3 Errors

ACME errors.

exception `acme.errors.Error`

Bases: `exceptions.Exception`

Generic ACME error.

exception `acme.errors.DependencyError`

Bases: `acme.errors.Error`

Dependency error

exception `acme.errors.SchemaValidationError`

Bases: `josepy.errors.DeserializationError`

JSON schema ACME object validation error.

exception `acme.errors.ClientError`

Bases: `acme.errors.Error`

Network error.

exception `acme.errors.UnexpectedUpdate`

Bases: `acme.errors.ClientError`

Unexpected update error.

exception `acme.errors.NonceError`

Bases: `acme.errors.ClientError`

Server response nonce error.

exception `acme.errors.BadNonce` (nonce, error, *args, **kwargs)

Bases: `acme.errors.NonceError`

Bad nonce error.

exception `acme.errors.MissingNonce` (response, *args, **kwargs)

Bases: `acme.errors.NonceError`

Missing nonce error.

According to the specification an “ACME server MUST include an `Replay-Nonce` header field in each successful response to a `POST` it provides to a client (...)”.

Variables `response` (`requests.Response`) – HTTP Response

exception `acme.errors.PollError` (*exhausted, updated*)

Bases: `acme.errors.ClientError`

Generic error when polling for authorization fails.

This might be caused by either timeout (`exhausted` will be non-empty) or by some authorization being invalid.

Variables

- **exhausted** – Set of `AuthorizationResource` that didn't finish within max allowed attempts.
- **updated** – Mapping from original `AuthorizationResource` to the most recently updated one

timeout

Was the error caused by timeout?

exception `acme.errors.ValidationError` (*failed_authzrs*)

Bases: `acme.errors.Error`

Error for authorization failures. Contains a list of authorization resources, each of which is invalid and should have an error field.

exception `acme.errors.TimeoutError`

Bases: `acme.errors.Error`

Error for when polling an authorization or an order times out.

exception `acme.errors.IssuanceError` (*error*)

Bases: `acme.errors.Error`

Error sent by the server after requesting issuance of a certificate.

exception `acme.errors.ConflictError` (*location*)

Bases: `acme.errors.ClientError`

Error for when the server returns a 409 (Conflict) HTTP status.

In the version of ACME implemented by Boulder, this is used to find an account if you only have the private key, but don't know the account URL.

Also used in V2 of the ACME client for the same purpose.

exception `acme.errors.WildcardUnsupportedError`

Bases: `acme.errors.Error`

Error for when a wildcard is requested but is unsupported by ACME CA.

1.4 Fields

ACME JSON fields.

class `acme.fields.Fixed` (*json_name, value*)

Bases: `josepy.json_util.Field`

Fixed field.

decode (*value*)

Decode a value, optionally with context JSON object.

encode (*value*)

Encode a value, optionally with context JSON object.

```
class acme.fields.RFC3339Field(json_name, default=None, omitempty=False, decoder=None,  
                             encoder=None)  
    Bases: josepy.json_util.Field  
    RFC3339 field encoder/decoder.  
    Handles decoding/encoding between RFC3339 strings and aware (not naive) datetime.datetime objects  
    (e.g. datetime.datetime.now(pytz.utc)).  
classmethod default_encoder(value)  
    Default (passthrough) encoder.  
classmethod default_decoder(value)  
    Default decoder.  
    Recursively deserialize into immutable types ( josepy.util.frozendict instead of dict(),  
    tuple() instead of list()).
```

```
class acme.fields.Resource(resource_type, *args, **kwargs)  
    Bases: josepy.json_util.Field  
    Resource MITM field.  
decode(value)  
    Decode a value, optionally with context JSON object.
```

1.5 JOSE

The `acme.jose` module was moved to its own package “`josepy`”. Please refer to its documentation there.

1.6 Messages

ACME protocol messages.

```
acme.messages.is_acme_error(err)  
    Check if argument is an ACME error.
```

```
exception acme.messages.Error(**kwargs)  
    Bases: josepy.json_util.JSONObjectWithFields, acme.errors.Error
```

ACME error.

<https://tools.ietf.org/html/draft-ietf-appsawg-http-problem-00>

Variables

- **typ**(*unicode*) –
- **title**(*unicode*) –
- **detail**(*unicode*) –

```
classmethod with_code(code, **kwargs)  
    Create an Error instance with an ACME Error code.
```

Unicode code An ACME error code, like ‘`dnssec`’.

Kwargs `kwargs` to pass to Error.

description

Hardcoded error description based on its type.

Returns Description if standard ACME error or `None`.

Return type unicode

code

ACME error code.

Basically `self.typ` without the `ERROR_PREFIX`.

Returns error code if standard ACME code or `None`.

Return type unicode

class `acme.messages._Constant` (*name*)

Bases: `josepy.interfaces.JSONDeSerializable`, `_abcoll.Hashable`

ACME constant.

to_partial_json ()

Partially serialize.

Following the example, **partial serialization** means the following:

```
assert isinstance(Bar().to_partial_json()[0], Foo)
assert isinstance(Bar().to_partial_json()[1], Foo)

# in particular...
assert Bar().to_partial_json() != ['foo', 'foo']
```

Raises `josepy.errors.SerializationError` – in case of any serialization error.

Returns Partially serializable object.

classmethod `from_json` (*obj*)

Deserialize a decoded JSON document.

Parameters `obj` – Python object, composed of only other basic data types, as decoded from JSON document. Not necessarily `dict` (as decoded from “JSON object” document).

Raises `josepy.errors.DeserializationError` – if decoding was unsuccessful, e.g. in case of unparseable X509 certificate, or wrong padding in JOSE base64 encoded string, etc.

class `acme.messages.Status` (*name*)

Bases: `acme.messages._Constant`

ACME “status” field.

class `acme.messages.IdentifierType` (*name*)

Bases: `acme.messages._Constant`

ACME identifier type.

class `acme.messages.Identifier` (***kwargs*)

Bases: `josepy.json_util.JSONObjectWithFields`

ACME identifier.

Variables

- `typ` (`IdentifierType`) –
- `value` (`unicode`) –

```
class acme.messages.Directory(jobj)
    Bases: josepy.interfaces.JSONDeSerializable

    Directory.

class Meta(**kwargs)
    Bases: josepy.json_util.JSONObjectWithFields

    Directory Meta.

    terms_of_service
        URL for the CA TOS

classmethod register(resource_body_cls)
    Register resource.

to_partial_json()
    Partially serialize.
```

Following the example, **partial serialization** means the following:

```
assert isinstance(Bar().to_partial_json()[0], Foo)
assert isinstance(Bar().to_partial_json()[1], Foo)

# in particular...
assert Bar().to_partial_json() != ['foo', 'foo']
```

Raises `josepy.errors.SerializationError` – in case of any serialization error.

Returns Partially serializable object.

```
classmethod from_json(jobj)
    Deserialize a decoded JSON document.
```

Parameters `jobj` – Python object, composed of only other basic data types, as decoded from JSON document. Not necessarily `dict` (as decoded from “JSON object” document).

Raises `josepy.errors.DeserializationError` – if decoding was unsuccessful, e.g. in case of unparseable X509 certificate, or wrong padding in JOSE base64 encoded string, etc.

```
class acme.messages.Resource(**kwargs)
    Bases: josepy.json_util.JSONObjectWithFields

    ACME Resource.
```

Variables `body` (`acme.messages.ResourceBody`) – Resource body.

```
class acme.messages.ResourceWithURI(**kwargs)
    Bases: acme.messages.Resource

    ACME Resource with URI.
```

Variables `uri` (`unicode`) – Location of the resource.

```
class acme.messages.ResourceBody(**kwargs)
    Bases: josepy.json_util.JSONObjectWithFields

    ACME Resource Body.
```

```
class acme.messages.ExternalAccountBinding
    Bases: object

    ACME External Account Binding
```

classmethod from_data (*account_public_key, kid, hmac_key, directory*)
 Create External Account Binding Resource from contact details, kid and hmac.

class `acme.messages.Registration` (**kwargs)

Bases: `acme.messages.ResourceBody`

Registration Resource Body.

Variables

- **key** (*josepy.jwk.JWK*) – Public key.
- **contact** (*tuple*) – Contact information following ACME spec, `tuple` of unicode.
- **agreement** (*unicode*) –

classmethod from_data (*phone=None, email=None, external_account_binding=None, **kwargs*)

Create registration resource from contact details.

phones

All phones found in the contact field.

emails

All emails found in the contact field.

class `acme.messages.NewRegistration` (**kwargs)

Bases: `acme.messages.Registration`

New registration.

class `acme.messages.UpdateRegistration` (**kwargs)

Bases: `acme.messages.Registration`

Update registration.

class `acme.messages.RegistrationResource` (**kwargs)

Bases: `acme.messages.ResourceWithURI`

Registration Resource.

Variables

- **body** (`acme.messages.Registration`) –
- **new_authzr_uri** (*unicode*) – Deprecated. Do not use.
- **terms_of_service** (*unicode*) – URL for the CA TOS.

class `acme.messages.ChallengeBody` (**kwargs)

Bases: `acme.messages.ResourceBody`

Challenge Resource Body.

Todo: Confusingly, this has a similar name to `challenges.Challenge`, as well as `achallenges.AnnotatedChallenge`. Please use names such as `challb` to distinguish instances of this class from `achall`.

Variables

- **`acme.challenges.Challenge`** – Wrapped challenge. Conveniently, all challenge fields are proxied, i.e. you can call `challb.x` to get `challb.chall.x` contents.
- **status** (`acme.messages.Status`) –

- **validated** (*datetime.datetime*) –
- **error** (*messages.Error*) –

encode (*name*)

Encode a single field.

Parameters **name** (*str*) – Name of the field to be encoded.

Raises

- **errors.SerializationError** – if field cannot be serialized
- **errors.Error** – if field could not be found

to_partial_json ()

Partially serialize.

Following the example, **partial serialization** means the following:

```
assert isinstance(Bar().to_partial_json()[0], Foo)
assert isinstance(Bar().to_partial_json()[1], Foo)

# in particular...
assert Bar().to_partial_json() != ['foo', 'foo']
```

Raises **josepy.errors.SerializationError** – in case of any serialization error.

Returns Partially serializable object.

classmethod fields_from_json (*obj*)

Deserialize fields from JSON.

uri

The URL of this challenge.

class `acme.messages.ChallengeResource` (***kwargs*)

Bases: `acme.messages.Resource`

Challenge Resource.

Variables

- **body** (`acme.messages.ChallengeBody`) –
- **authzr_uri** (*unicode*) – URI found in the ‘up’ Link header.

uri

The URL of the challenge body.

class `acme.messages.Authorization` (***kwargs*)

Bases: `acme.messages.ResourceBody`

Authorization Resource Body.

Variables

- **identifier** (`acme.messages.Identifier`) –
- **challenges** (*list*) – list of `ChallengeBody`
- **combinations** (*tuple*) – Challenge combinations (tuple of tuple of int, as opposed to list of list from the spec).
- **status** (`acme.messages.Status`) –

- **expires** (*datetime.datetime*) –

resolved_combinations

Combinations with challenges instead of indices.

class `acme.messages.NewAuthorization` (**kwargs)

Bases: `acme.messages.Authorization`

New authorization.

class `acme.messages.AuthorizationResource` (**kwargs)

Bases: `acme.messages.ResourceWithURI`

Authorization Resource.

Variables

- **body** (`acme.messages.Authorization`) –
- **new_cert_uri** (*unicode*) – Deprecated. Do not use.

class `acme.messages.CertificateRequest` (**kwargs)

Bases: `josepy.json_util.JSONObjectWithFields`

ACME new-cert request.

Variables **csr** (`josepy.util.ComparableX509`) – `OpenSSL.crypto.X509Req` wrapped in `ComparableX509`

class `acme.messages.CertificateResource` (**kwargs)

Bases: `acme.messages.ResourceWithURI`

Certificate Resource.

Variables

- **body** (`josepy.util.ComparableX509`) – `OpenSSL.crypto.X509` wrapped in `ComparableX509`
- **cert_chain_uri** (*unicode*) – URI found in the ‘up’ Link header
- **authzrs** (*tuple*) – tuple of `AuthorizationResource`.

class `acme.messages.Revocation` (**kwargs)

Bases: `josepy.json_util.JSONObjectWithFields`

Revocation message.

Variables **certificate** (`ComparableX509`) – `OpenSSL.crypto.X509` wrapped in `ComparableX509`

class `acme.messages.Order` (**kwargs)

Bases: `acme.messages.ResourceBody`

Order Resource Body.

Variables

- **of .Identifier** (*list*) – List of identifiers for the certificate.
- **status** (`acme.messages.Status`) –
- **of str authorizations** (*list*) – URLs of authorizations.
- **certificate** (*str*) – URL to download certificate as a fullchain PEM.
- **finalize** (*str*) – URL to POST to to request issuance once all authorizations have “valid” status.

- **expires** (*datetime.datetime*) – When the order expires.
- **error** (*Error*) – Any error that occurred during finalization, if applicable.

class `acme.messages.OrderResource` (***kwargs*)

Bases: `acme.messages.ResourceWithURI`

Order Resource.

Variables

- **body** (`acme.messages.Order`) –
- **csr_pem** (*str*) – The CSR this Order will be finalized with.
- **of** `acme.messages.AuthorizationResource` **authorizations** (*list*) – Fully-fetched AuthorizationResource objects.
- **fullchain_pem** (*str*) – The fetched contents of the certificate URL produced once the order was finalized, if it's present.

class `acme.messages.NewOrder` (***kwargs*)

Bases: `acme.messages.Order`

New order.

1.7 Standalone

Internal class delegating to a module, and displaying warnings when attributes related to TLS-SNI-01 are accessed.

class `acme.standalone.ACMEServerMixin`

ACME server common settings mixin.

class `acme.standalone.BaseDualNetworkedServers` (*ServerClass, server_address, *remaining_args, **kwargs*)

Bases: `object`

Base class for a pair of IPv6 and IPv4 servers that tries to do everything it's asked for both servers, but where failures in one server don't affect the other.

If two servers are instantiated, they will serve on the same port.

serve_forever ()

Wraps `socketserver.TCPServer.serve_forever`

getsocknames ()

Wraps `socketserver.TCPServer.socket.getsockname`

shutdown_and_server_close ()

Wraps `socketserver.TCPServer.shutdown`, `socketserver.TCPServer.server_close`, and `threading.Thread.join`

class `acme.standalone.BaseRequestHandlerWithLogging` (*request, client_address, server*)

Bases: `SocketServer.BaseRequestHandler`

BaseRequestHandler with logging.

log_message (*format, *args*)

Log arbitrary message.

handle ()

Handle request.

```

class acme.standalone.HTTP01DualNetworkedServers (*args, **kwargs)
    Bases: acme.standalone.BaseDualNetworkedServers

    HTTP01Server Wrapper. Tries everything for both. Failures for one don't affect the other.

class acme.standalone.HTTP01RequestHandler (*args, **kwargs)
    Bases: BaseHTTPServer.BaseHTTPRequestHandler

    HTTP01 challenge handler.

    Adheres to the stdlib's socketserver.BaseRequestHandler interface.

    Variables simple_http_resources (set) – A set of HTTP01Resource objects. TODO:
        better name?

class HTTP01Resource (chall, response, validation)
    Bases: tuple

    __asdict ()
        Return a new OrderedDict which maps field names to their values

    classmethod __make (iterable, new=<built-in method __new__ of type object>, len=<built-in
        function len>)
        Make a new HTTP01Resource object from a sequence or iterable

    __replace (**kws)
        Return a new HTTP01Resource object replacing specified fields with new values

    chall
        Alias for field number 0

    response
        Alias for field number 1

    validation
        Alias for field number 2

    log_message (format, *args)
        Log arbitrary message.

    handle ()
        Handle request.

    handle_index ()
        Handle index page.

    handle_404 ()
        Handler 404 Not Found errors.

    handle_simple_http_resource ()
        Handle HTTP01 provisioned resources.

    classmethod partial_init (simple_http_resources)
        Partially initialize this handler.

        This is useful because socketserver.BaseServer takes uninitialized handler and initializes it with
        the current request.

class acme.standalone.HTTP01Server (server_address, resources, ipv6=False)
    Bases: acme.standalone.HTTPServer, acme.standalone.ACMEServerMixin

    HTTP01 Server.

class acme.standalone.HTTPServer (*args, **kwargs)
    Bases: BaseHTTPServer.HTTPServer

```

Generic HTTP Server.

```
class acme.standalone.TLSSNI01DualNetworkedServers (*args, **kwargs)
    Bases: acme.standalone.BaseDualNetworkedServers
```

TLSSNI01Server Wrapper. Tries everything for both. Failures for one don't affect the other.

```
class acme.standalone.TLSSNI01Server (server_address, certs, ipv6=False)
    Bases: acme.standalone.TLSServer, acme.standalone.ACMEServerMixin
```

TLSSNI01 Server.

```
class acme.standalone.TLSServer (*args, **kwargs)
    Bases: SocketServer.TCPServer
```

Generic TLS Server.

```
acme.standalone.simple_tls_sni_01_server (cli_args, forever=True)
    Run simple standalone TLSSNI01 server.
```

ACME protocol implementation.

This module is an implementation of the [ACME](#) protocol.

```
class acme._TLSSNI01DeprecationModule (module)
    Bases: object
```

Internal class delegating to a module, and displaying warnings when attributes related to TLS-SNI-01 are accessed.
