---

## About this Document

---

This document has changed much over the years. Part encyclopedia, part how-to guide, with multiple sedimentary layers of accreted information from more than two decades of API development and refinement.

Yes, there does need to be one source of information about every last niggling detail of the After Effects APIs. However, since no human in their right mind would ever want to *read* such a document, we've tried to keep it involving and interesting.

As opportunity allows, we'll try to include more diagrams, illustrations, and purdy pickshurs explaining API intricacies.

As always, your input is valued and appreciated.

---

## 1.1 Organization

The *Introduction* provides an overview of the integration possibilities with After Effects. It explains what plug-ins are, and how they work with After Effects. It describes the sample projects, and how to modify them. It explains where to install plug-ins, and what resources they use.

The basics of effect plug-ins are discussed in *Effect Basics*. This overview provides information on the function parameters passed to and from an effect plug-in's entry point. It describes capability flags, effect parameters, and image buffers.

*Effect Details* dives into the details of developing a complete effect plug-in using the many provided callback functions. It also provides many testing ideas to ensure the plug-in is stable.

*SmartFX* is the extension to the effect plug-in API to support 32-bit floating point images.

*Effect UI & Events* covers events sent to effect plug-ins, how to incorporate custom user interface elements, parameter supervision, and the reliance of custom data parameter types on Custom UI messaging.

*Audio* effects are covered in... *Audio*.

*AEGBPs* details the After Effects General Plug-in (AEGP) API. Provided callback functions, hooking into internal messaging, manipulating the current contents of open projects and handling menu commands are all covered at length.

---

*Artisans* covers specialized plug-in 3D renderer AEGPs.

*AEIOs*, specialized AEGPs which handle file input and output.

*Premiere Pro & Other Hosts* discusses issues related to compatibility with Premiere Pro and other applications that support a subset of After Effects plug-ins.

---

## 1.2 Documentation Conventions

Functions, structure names and general C/C++ code are in Courier; `MyStruct` and `MyFunction()`;

Text in blue is hyperlinked.

Command selectors are italicized; *PF\_Cmd\_RENDER*.

---

## 1.3 A Note About Coding Style

Because we use the public APIs for our own plug-ins, our coding guidelines are apparent throughout the SDK. Here's a description of the pseudo-neo-post-Hungarian notation we use. Of course, you're welcome to code however you like. If you feel strongly that we should change our internal coding standards, please post your requests at [comp.sys.programmer.better.things.to.do.with.your.time](http://comp.sys.programmer.better.things.to.do.with.your.time), and we'll carefully consider them before not making any changes.

### 1.3.1 Coding Conventions

| Type   | Suffix       | Example        |
|--|--------------|----------------|
| Handle   | <b>H</b>     | fooH           |
| pointer (to)                                     | <b>P</b>     | fooP           |
| Boolean  | <b>B</b>     | visibleB       |
| Float  | <b>F</b>     | degreesF       |
| Long   | <b>L</b>     | offsetL        |
| unsigned long                                    | <b>Lu</b>    | countLu        |
| short  | <b>S</b>     | indexS         |
| char   | <b>C</b>     | digitC         |
| unsigned char                                    | <b>Cu</b>    | redCu          |
| function pointer                                 | <b>_func</b> | sample_func    |
| time value                                       | <b>T</b>     | durationT      |
| char* (NULL-terminated C string)                 | <b>Z</b>     | nameZ          |
| rectangle  | <b>R</b>     | boundsR        |
| fixed rectangle                                  | <b>FiR</b>   | boundsFiR      |
| float rectangle                                  | <b>FR</b>    | boundsFR       |
| ratio  | <b>Rt</b>    | scale_factorRt |
| void*  | <b>PV</b>    | refconPV       |
| optional parameter (must be passed, can be NULL) | <b>0</b>     | extra_flags0   |

## CHAPTER 2

### Version History

| Revision Date    | Documentor   | Notes   |
|------------------|--------------|---|
| 1 November 2018  |              | 16.0 release  |
| 10 November 2017 | Zac Lam      | 15.0 release  |
| 12 May 2017      | Zac Lam      | CC 2017.1 (14.2) release  |
| 2 November 2016  | Zac Lam      | CC 2017 (14.0) release.   |
| 21 July 2015     | Zac Lam      | CC 2015 (13.5) release.   |
| 12 June 2014     | Zac Lam      | CC 2014 (13.0) release. Corrections for accuracy. Removed old version references.   |
| 15 July 2013     | Zac Lam      | CC (12.0) release. API version changes, misc small clarifications, more details in <i>AEIOs</i> .   |
| 26 April 2012    | Zac Lam      | CS6 (11.0) release. Big reorganization of the <i>AEGPs</i> and <i>Artisans</i> . Many additions throughout.   |
| 2 May 2011       | Zac Lam      | CS5.5 (10.5) release.   |
| 28 April 2010    | Zac Lam      | CS5 (10.0) release. 64-bit porting info. Drawbot.   |
| 4 May 2009       | Zac Lam      | CS4 (9.0) release. Complete reorganization of first three chapters. Fleshed out documentation on Premiere Pro.  |
| 1 July 2007      | Bruce Bullis | CS3 (8.0) release.  |
| 4 April 2006     | Bruce Bullis | Updated to reference new development system requirements and development process. Some editing.   |
| 1 December 2005  | Bruce Bullis | Updated for 7.0. Added SmartFX documentation. Noted current suite version numbers throughout. Numerous editorial changes. Documented many new AEGP suite functions. |

# CHAPTER 3

---

## Introduction

---

Welcome to the Adobe® After Effects® CC Software Development Kit!

This is a living document, and is constantly being updated and edited. The latest public version of the SDK is available at: <https://www.adobe.io/apis/creativecloud/aftereffects.html>

While we've tried to organize this document in a logical order and provide plenty of cross references, your specific needs may vary. Searching through this document based on keywords will often lead you to your answer.

If you need more information, your question may already be answered on the After Effects SDK forum: [After Effects SDK Forum](#)

Use the search box there, and post a new question if your question hasn't already been answered.

---

## What Can I Do With This SDK?

---

This SDK describes the Application Programming Interface (API) that developers use to build plug-ins. These plug-ins can extend the capabilities of After Effects and other applications that support the After Effects API. Plug-ins may also be used to bridge the gap between After Effects and another application.

---

### 4.1 What Plug-Ins Can I Build With This SDK?

*Effect plug-ins* can be applied to video or audio in a composition, to process video and/or audio data. Some examples of built-in effects are Brightness and Contrast, Hue/Saturation, Gaussian Blur, and Warp Stabilizer. Effect plug-ins can provide a set of parameter controls for the user to fine-tune the effect. These parameter values can vary over time, and effects may use other layers and parameters at different times to calculate the output. It's often thought that all plug-ins are effects. But effects are just one type of plug-in used by After Effects.

See a quickstart video on building an effect (on macOS): [adobe.ly/2sjMDwM](https://adobe.ly/2sjMDwM)

*After Effects General Plug-ins (AEGPs)* can read and modify nearly every element of After Effects projects and preferences. They can add menu items, 'hook' (register themselves to receive) and trigger After Effects' internal commands, and add new panels that dock and resize within the After Effects UI. They can work with markers and keyframes, and manage the render queue. They can even run scripts. Some examples of built-in AEGPs are the AAF importer, and the SWF exporter. Automatic Duck Pro Import AE is another well-known AEGP.

*After Effects Input/Output (AEIO) plug-ins* provide support for new media file types. Unless you need a custom setup dialog to specify interpretation settings, the *Premiere Pro Importers* API provides similar functionality, and is preferable in many cases. AEIOs use the AEGP API along with certain APIs specific to AEIOs. While After Effects still supports Photoshop format plug-ins and filters, as well as Foreign Project Format (FPF) plug-ins, these APIs have been long deprecated in favor of the AEIO API.

*BlitHook* plug-ins output video to external hardware for broadcast quality monitoring and playback to tape. The EMP sample project provides a starting point. In After Effects CC 2014 and later, *Mercury Transmit* is the recommended API.

*Artisans* provide rendered output of 3D layers, taking over 3D rendering from After Effects (which still handles all rendering of 2D layers). Artisans use the AEGP API along with certain APIs specific to Artisans.

Didn't see the type of integration you need described above? After Effects is very flexible, and there are several other ways to integrate with After Effects. See: *Other Integration Possibilities*.

---

## 4.2 Where Do Plug-ins Appear In After Effects?

Effects plug-ins appear in both the *Effect* menu and the Effects & Presets panel, in the effect category specified in their PiPL. Once they're applied, the effect's parameter controls (sliders, pop-ups, etc.) appear in the Effect Controls panel (ECP).

After Effects General Plug-ins (AEGPs) can add items to any After Effects menu, and additional panels listed in the Window menu. These menu items are indistinguishable from After Effects' own menu items.

*AEIOs* and Photoshop Format plug-ins can appear in the *File > Import* menu, or in the *Import File* dialog in the *Files of type* drop-down, depending on the type of importer. AEIOs and Format plug-ins can also appear as available output formats in the render queue.

BlitHook plug-ins are automatically loaded and used by AE, but do not appear in any menu or dialog. The plug-in may optionally provide a menu item that opens it's own custom settings dialog. It would register and update the menu item using the AEGP API.

It can registered to be called by After Effects to update the menu with `AEGP_RegisterUpdateMenuHook()`, and it can dim/activate the menu item using `AEGP_EnableCommand()/DisableCommand()`.

Artisans appear in the *Rendering Plug-in* drop-down in the *Advanced* tab of the *Composition Settings* dialog.

---

## 4.3 How Does After Effects Interact With Plug-ins?

Plug-ins, written in C or C++, are bundle packages on macOS and DLLs on Windows. They must contain a Plug-in Property List (*PiPL Resources*) resource on both platforms. The plug-ins must be located in one of a few specific folders in order to be loaded and used by After Effects.

For effects plug-ins, After Effects sends command selectors (and relevant information) to the plug-in *Entry Point* designated in the effects' *PiPL Resources* resource. Selectors are sent in response to actions the user takes—applying the effect, changing parameters, scrubbing through frames in the timeline, and rendering all prompt different sequences of selectors.

After Effects creates multiple instances of effects, with settings and input data unique to each sequence. All instances share the same global data, and can share data between all frames within their sequence. After Effects doesn't process all image data as soon as the user applies an effect; it invokes effects only when their output is required.

After Effects General Plug-ins (AEGPs) have their entry point function called during application launch, and register for whatever messaging they need at that time. Further calls to the AEGP are initiated by user actions, as part of the plug-in's response to menu commands or UI events. Depending on their features, plug-ins may need to respond to OS-specific entry points as well, for UI work and thread management.

For BlitHook plug-ins, frames are pushed as they're displayed in the Composition panel. Users can initiate a RAM preview on an area of the timeline so that it is rendered to RAM, and then it all gets played out at full speed.

---

## 4.4 SDK Contents

The SDK contains headers defining the After Effects APIs, sample projects demonstrating integration features, and this SDK Guide.

They are compiled with the SDK header files, which expose various After Effects functionality to be used by the plug-in.

---

## Other Integration Possibilities

---

Although this SDK describes the majority of integration possibilities with After Effects, there are other possibilities not to be overlooked.

---

### 5.1 Scripting

Scripting is a relatively nimble and lightweight means to perform automated tasks with After Effects. ScriptUI is one way you can provide UI integration with custom dialogs and panels (see *HTML5 Panels* too). And scripting may be used in tandem with plug-in development, in the cases where a certain function is made available via scripting and not via the C APIs described in this document.

Scripting in After Effects is done using ExtendScript, based on JavaScript. After Effects includes the ExtendScript ToolKit, a convenient interface for creating and testing your own scripts. Scripts may be compiled into .jsxbin binary files, to protect intellectual property.

You can access the After Effects Scripting Guide, and find a link to the scripting forums, on the Adobe I/O website at: <https://www.adobe.io/apis/creativecloud/aftereffects.html>

After Effects can be driven by executing scripts from the commandline. In your script, you can open the project and run script actions on it. So for example, you can execute the following statement to run a script from the command line directly:

```
AfterFX -s "app.quit()"
```

Or you can execute this statement to run a .jsx script that includes a quit at the end:

```
AfterFX -r path_to_jsx_script
```

On Windows, AfterFX.com is the way to get feedback to the console, because AfterFX.com is a command line application.

---

## 5.2 HTML5 Panels

In CC 2014 and later, After Effects supports HTML5 panels. They are accessed in After Effects from Window > Extensions > (your panel name). Panels can be resized and docked just like any other panel in After Effects. Panels are built using HTML5, After Effects Scripting, and JavaScript. You may download the After Effects Panel SDK from the the Adobe I/O website at: <https://www.adobe.io/apis/creativecloud/aftereffects.html>

---

## 5.3 AERender

Closely coupled with scripting is the command line interface offered by aerender. aerender is primarily suited to allow automated renders, but can be used to execute any sequence of scripting commands from the command line. An overview is available in the After Effects help documents here: <https://helpx.adobe.com/after-effects/using/automated-rendering-network-rendering.html>

---

## 5.4 Premiere Pro Importers

Premiere Pro importers provide support for importing media into applications across most applications in the Adobe Creative Cloud, including Premiere Pro, Media Encoder, Prelude, and Audition. Because of this broader compatibility, unless you need very specific integration with After Effects only available via the AEIO API in this SDK, we recommend developing a Premiere Pro importer. The Premiere Pro SDK is available at: <https://www.adobe.io/apis/creativecloud/premierepro.html>

One advantage of MediaCore importer plug-ins over AEIOs is its priority system: The highest priority importer gets first crack at importing a file, and if the particular imported file isn't supported, the next-highest priority importer will then have the opportunity to try importing it, and so on.

---

## 5.5 Mercury Transmit

Mercury Transmit plug-ins are used for sending video to output hardware for broadcast-quality monitoring. Transmitters are supported across most applications in the Adobe Creative Cloud, including Premiere Pro, After Effects, Prelude, and Character Animator. The Mercury Transmit API is documented in the Premiere Pro SDK, available at: [https:// www.adobe.io/apis/creativecloud/premierepro.html](https://www.adobe.io/apis/creativecloud/premierepro.html)

You must be a proficient C/C++ programmer to write After Effects plug-ins. While we'll help with issues specific to the After Effects API, we can't help you learn your IDE or basic programming concepts.

This SDK guide assumes you understand After Effects from a user's perspective, and basic motion graphics terminology. If you don't, get the [Adobe After Effects Classroom in a Book](#), or any of the other fine instructional books on the market. It will help you understand necessary

topics such as alpha channels, pixel aspect ratio, interlacing, color spaces, and more for After Effects.

---

## 6.1 Development Requirements

The system requirements for After Effects are here: <https://helpx.adobe.com/after-effects/system-requirements.html>

If you require support for obsolete versions of the application or API, use an old SDK (which we don't maintain or provide). Six months after the current version is released, we will no longer provide or support the previous version's SDK.

The SDK samples are created for Xcode 7.3 on macOS 10.11, and Microsoft Visual Studio 2015 update 3 on Windows 7 64 or Windows 10. Yes, we're being pretty stringent about using the required IDE. No, it's never pleasant to move to a new compiler, but no, we're not going to continue to help with older build environments.

In order to use Visual Studio, you may need to adjust some installation settings to install the components for compiling 64-bit plug-ins. Visual Studio Express may be used, but will also require an additional installation to compile 64-bit plug-ins, as described here: <http://msdn.microsoft.com/en-us/library/9yb4317s.aspx>

To compile using newer versions of Xcode on newer versions of macOS, often all that is required is to update the Base SDK in the Build Settings.

If this is your first time developing an After Effects plug-in, you can skip the What's New section and go directly to *How To Start Creating Plug-ins*.

---

### 7.1 What's New In CC 2019 (16.0)?

We've made some changes to how GPU effects are handled. See "GPU Effects Changes" for details.

---

### 7.2 What's New In 15.0?

After Effects now supports the *GPU effect rendering* previously supported in Premiere Pro. Note that unknown effects with a match name that includes "ADBE " will be excluded from GPU rendering, so make sure any of your GPU effects have your own custom match name. Effects that support GPU rendering will receive the GPU badge in the Effect panel.

The GPU effect sample projects in the Premiere Pro SDK have been updated to register as GPU effects in AE, although the render output still needs work.

A new entry point has been defined, to allow effects to register basic information with the host at runtime, without relying on legacy PiPL resources. An effect can register multiple entry points in a single binary this way. Premiere Pro is the first host to support this entry point, and After Effects will support this in a future release.

The effect sample projects have been updated to use this approach, while maintaining the PiPL for backwards compatibility.

`AEGP_StreamSuite` is now at version 5, where `AEGP_GetExpression()` and `AEGP_SetExpression()` have been upgraded to support Unicode.

`PF_AdvTimeSuite` is now at version 4, with a new call `PF_TimeCountFrames()`, that returns the index of the frame in the current comp.

The new AEGP Math Suite provides helpful calls for matrix multiplication.

The application font is now Adobe Clean. Previously, the fonts used in After Effects' UI were Tahoma on Windows and Lucida Grande on macOS X. This is a proprietary font, and we can not make it available for use in your UI.

---

## 7.3 What's New In CC 2017.1 (14.2)?

- Layer Params can include Masks and Effects

Effects that use layers as an input, such as Set Matte and Displacement Map, can now target the input layer's masks and effects, instead of only the source of the layer. This means that for there is no need to pre-compose layers just so that they can be referenced by an effect.

Where an effect includes a layer parameter, a new menu to the right of the layer selector allows you to choose whether to target the input layer from its source, masks, or effects:

- Source: targets only the source of the layer. Masks and effects are ignored.
- Masks: targets the layer after its masks are applied. Effects are ignored.
- Effects & Masks: targets the layer after its masks and effects are applied.

This control is similar to the View menu at the bottom of the Layer viewer panel, which allows you to render the layer from different positions in the rendering order: from its source, from its masks, or from its individual effects.

As this is a user-facing option, the design is intended to be transparent to the effect. From the effect's perspective, the input simply just includes the upstream effects and masks without any change to the effect. For any effect that uses layer params, here are some testing recommendations:

- Effect continues to work as expected.
- Using new control in the layer param for Source/Mask/Effects works with effect.
- Opening old projects or saving back to a previous version project does not break effect.
- Confirm that effect cannot self-reference; meaning cannot use the effects on the layer as input for the same layer.
- Suite Enhancements

`PF_AdvTimeSuite` is now at version 3, providing a revised `PF_GetTimeDisplayPref()` call that uses a revised `PF_TimeDisplayPrefVersion` parameter, that supports higher frame rates. The previous version 2 of the call can now return an error if there is a problem with the values exceeding the range supported by the structure.

Comp Suite is now at version 11, with a new call, `AEGP_ReorderCompSelection()`, to move a selection to a certain layer index. It should be used along with `AEGP_SetSelection()`.

---

## 7.4 What's New In CC 2017 (14.1)?

Unicode support for *AEGP Item Suite* and *AEGP Render Queue Item Suite*.

---

## 7.5 What's New In CC 2017 (14.0)?

The GLator sample is back! It has been updated to demonstrate proper OpenGL context management in an effect plug-in.

---

## 7.6 What's New In CC 2015.3 (13.8)?

PF\_OutFlag\_I\_AM\_OBSOLETE is now supported in Premiere Pro. Also, effect custom UI in Premiere Pro now supports high DPI displays, such as Retina Displays.

---

## 7.7 What's New In CC 2015 (13.6)?

New AEGP Item View Suite. This provides a way to get playback time for item view. Only the composition case is implemented in this release. The time passed back should be the playback time of the view when playing and the current (needle) time otherwise.

AEGP\_RenderNewItemSoundData() has been reworked and provides functionality similar to 13.2.

---

## 7.8 What's New In CC 2015 (13.5.1)?

This release fixes some audio APIs that broke in 13.5 due to threading changes. In 13.5, when called on the UI thread, AEGP\_RenderNewItemSoundData() would return A\_Err\_GENERIC. This restores the functionality when called on the UI thread.

To avoid a deadlock, in PF\_Cmd\_UPDATE\_PARAMS\_UI only, AEGP\_RenderNewItemSoundData() will now return silence. This will no longer function as before in this context, but it will continue to work properly elsewhere.

---

## 7.9 What's New In CC 2015 (13.5)?

- Separate UI and Render Threads

This release of After Effects includes major architectural changes to separate the UI (main) thread from the render thread. The render thread sends selectors such as PF\_Cmd\_RENDER, PF\_Cmd\_SMART\_PRERENDER, and PF\_Cmd\_SMART\_RENDER to effect plug-ins. The UI thread sends selectors such as PF\_Cmd\_SEQUENCE\_SETUP, PF\_Cmd\_USER\_CHANGED\_PARAM, PF\_Cmd\_DO\_DIALOG, and PF\_EVENT\_DRAW. PF\_Cmd\_SEQUENCE\_RESETUP is

sent on both render and UI threads.

These changes are to improve interactive performance and responsiveness. At the same time, the new design introduces some new requirements and may break assumptions that existing plug-ins relied on. Here are some of the major changes:

- 1) The project can no longer be modified by the render thread (and in fact the render thread now has its own local copy of the project)
- 2) Rendering cannot pass modified sequence data back to the UI thread for custom UI updates
- 3) In general the UI thread should no longer do time-consuming operations such as synchronously rendering frames

Is your plug-in affected? Test for these problems:

- 1) Render not updating after UI parameter change because it depends on `sequence_data`, which may not be currently copied to render
- 2) Render not updating during click/drag in the Composition Window (similar reasons)
- 3) Custom Effect UI not updating because it depends on `sequence_data` generated in render (which is no longer available to the UI because it is in a different project, the render project is immutable, and cache contains previously-rendered frames)
- 4) Errors telling you an operation on the render thread (or UI thread) is not expected

Generally, calculations that will persist or update the UI will now have to be pulled from the UI thread rather than pushed from the render thread. These cases can require use of new

13.5 APIs or different solutions than in past releases.

- The Need For More Efficient Sequence Data Handling

`PF_OutFlag2_SUPPORTS_GET_FLATTENED_SEQUENCE_DATA`

`PF_Cmd_GET_FLATTENED_SEQUENCE_DATA`

Up to version 13.2, serializing/flattening `sequence_data` always involved deallocating and reallocating any data structures. Starting in 13.5, as effect changes are made, serializing/ flattening happens even more often. Why? AE needs to serialize/flatten project changes to send from the UI thread to the render thread, to keep them both synchronized.

To make this process more efficient, starting in 13.5, AE can send `PF_Cmd_GET_FLATTENED_SEQUENCE_DATA` to request sequence data without requiring the existing data to be deallocated and reallocated. The main difference between this selector and `PF_Cmd_SEQUENCE_FLATTEN` is that a copy of the correct flattened state is returned without disposing the original structure(s) the effect is currently using. For a code example, refer to the PathMaster sample project.

This will eventually become required for plug-ins that are rebuilt to be thread-safe (see `PF_OutFlag2_AE13_5_THREADSAFE` below). The venerable `PF_Cmd_SEQUENCE_FLATTEN` will eventually be unsupported in future versions.

- `PF_OutFlag_FORCE_RERENDER` Changes

Where possible, we recommend triggering renders using one of the following: `GuidMixInPtr()` (described in the next section), `arb data`, or `PF_ChangeFlag_CHANGED_VALUE`. All of these allow cached frames to be reused after an Undo.

Note: As of 14.0, setting `PF_ChangeFlag_CHANGED_VALUE` for layer or path params is not triggering a rerender. Instead, you may change set the value using `AEGP_StreamSuite-`

`>AEGP_SetStreamValue()`.

`FORCE_RERENDER` is still needed for situations where `sequence_data` needs to be copied from the UI thread to the render project/effect clone to keep them matched.

`FORCE_RERENDER` is the trigger for this whether the render request uses the cache or not. Once we have the full set of APIs in place needed to manage render state, we will be able to deprecate `FORCE_RERENDER`.

`FORCE_RERENDER` doesn't work in every situation it did before, because it needs to synchronize the UI copy of `sequence_data` with the render thread copy.

FORCE\_RERENDER works when set during PF\_Cmd\_USER\_CHANGED\_PARAM. It also works in CLICK and DRAG events, but only if PF\_Cmd\_GET\_FLATTENED\_SEQUENCE\_DATA is implemented. This is required to prevent flattening and loss of UI state in the middle of mouse operations. Without GET\_FLATTENED, the new FORCE\_RERENDER behavior will NOT be turned on.

- GUIDs for Cached Frames

PF\_OutFlag2\_I\_MIX\_GUID\_DEPENDENCIES

GuidMixInPtr()

Used by SmartFX only. Use this if custom UI or PF\_Cmd\_DO\_DIALOG changes sequence data, or if the render result depends on anything else not factored in, and rerendering may be needed. During PF\_Cmd\_SMART\_PRERENDER, the effect can call GuidMixInPtr() to mix any additional state that affects the render into our internal GUID for the cached frame. Using this GUID, AE can tell whether the frame already exists or if it needs to be rendered. See an example in SmartyPants sample project.

This is an improvement over the older mechanisms PF\_OutFlag\_FORCE\_RERENDER and PF\_Cmd\_DO\_DIALOG, which would remove the frame from the cache because the host didn't know what else the plug-in was factoring into the rendering. This can also be used rather than PF\_OutFlag2\_OUTPUT\_IS\_WATERMARKED.

- Request Frames Asynchronously Without Blocking the UI

PF\_OutFlag2\_CUSTOM\_UI\_ASYNC\_MANAGER

PF\_GetContextAsyncManager() AEGP\_CheckoutOrRender\_ItemFrame\_AsyncManager()  
AEGP\_CheckoutOrRender\_LayerFrame\_AsyncManager()

For cases where such renders formerly were triggered by side-effect or cancelled implicitly

(such as custom UI histogram drawing), and lifetime is less clear from inside the plug-in, use the new “Async Manager” which can handle multiple simultaneous async requests for effect Custom UI and will automatically support interactions with other AE UI behavior.

Note: Async retrieval of frames is preferred for handling passive drawing situations, but not when a user action will update the project state. If you are (1) responding to a specific user click, AND 2) you need to update the project as a result, the synchronous AEGP\_RenderAndCheckoutLayerFrame() is recommended.

The new HistoGrid sample in the SDK shows how to do completely asynchronous custom UI DRAW event handling on the UI thread when 1 or more frame renders are needed. e.g. for calculating histograms that are shown in the effect pane. Please note there is still a known bug where drag-changing an upstream param may not refresh the histogram draw until the mouse hovers over it.

- Get Rendered Output of an Effect from its UI

Effects such as keyers or those that draw histograms of post-processed video can retrieve the needed AEGP\_LayerRenderOptionsH using the new function AEGP\_NewFromDownstreamOfEffect() in AEGP\_LayerRenderOptionsSuite. This function may only be called from the UI thread.

- AEGP Usage on Render Thread

We've tightened validation of when AEGP calls could be used dangerously (such as from the wrong thread or making a change to the project state in render). You may see new errors if code is hitting such cases. For example, making these calls on the render thread will result in an error:

```
suites.UtilitySuite5()->AEGP_StartUndoGroup() suites.StreamSuite2()->AEGP_GetStreamName()
suites.StreamSuite2()->AEGP_SetExpressionState() suites.StreamSuite2()->AEGP_SetExpression()
suites.StreamSuite2()->AEGP_GetNewLayerStream() suites.StreamSuite2()->AEGP_DisposeStream()
suites.EffectSuite3()->AEGP_DisposeEffect() suites.UtilitySuite5()->AEGP_EndUndoGroup()
```

The solution is to move these calls to the UI thread. Selectors for passive UI updates (such as PF\_EVENT\_DRAW) are not a place to make changes to project state.

Another example of more strict requirements is `AEGP_RegisterWithAEGP()`. The documentation has always noted that this function must be called on `PF_Cmd_GLOBAL_SETUP`. However in previous versions, plug-ins were able to call this function at other times without running into trouble. Not anymore in 13.5! Calling this function at other times can cause crashes!

- `PF_Cmd_SEQUENCE_RESETUP` Called on UI or Render Thread?

There is now a `PF_InFlag_PROJECT_IS_RENDER_ONLY` flag that is only valid in `PF_Cmd_SEQUENCE_RESETUP` that will tell you if the effect instance is for render-only purposes. If so, the project should be treated as completely read-only, and you will not be receiving UI related selectors on that effect instance. This can be used to optimize away any UI-only initialization that render does not need. If this flag is false, you should setup UI as normal. This should not be used to avoid reporting errors in render. Errors in render should be reported as usual via existing SDK mechanisms.

- Changes to Avoid Deadlocks

During development, it was noticed that deadlocks could occur in specific call usage. Seatbelts have been introduced to avoid this. The cases occur in `PF_Cmd_UPDATE_PARAMS_UI` when using particular calls because of deprecated synchronous behavior in these calls when used in the UI:

In `PF_Cmd_UPDATE_PARAMS_UI` only, `PF_PARAM_CHECKOUT()` for layer parameters will behave as before except that it will return a black frame of the same size, etc., rather than actual rendered pixels. Code that used this for enable/disable detection of parameters should still work as before. Code that used this for getting analysis frames, etc. outside of `PF_Cmd_UPDATE_PARAMS_UI` will work as before.

In `PF_Cmd_UPDATE_PARAMS_UI` only, `PF_GetCurrentState()` will now return a random GUID. This will no longer function as before in this context, but it will continue to work properly elsewhere.

The above uses should be rare, but if this affects you please contact us about workarounds.

- Deprecated

`AEGP_RenderAndCheckoutFrame()` (on the UI Thread). This call should generally not be used on the UI thread since synchronous renders block interactivity.

Use in the render thread is fine. The one case where this may still be useful on the UI thread is a case like a UI button that requires a frame to calculate a parameter which then updates the AE project.

For example, an “Auto Color” button that takes a frame and then adjusts effect params as a result.

A beta of a progress dialog for this blocking operation if it is slow has been implemented, but using this call on the UI thread should be limited to this special cases. The dialog design is not final.

- Flag for Thread-Safe Effects

`PF_OutFlag2_AE13_5_THREADSAFE`

Plug-ins updated for threading should use this flag to tell AE that the plug-in is expected to be UI thread <> Render thread safe.

This flag tells AE that different threads on different AE project copies can be in the effect at the same time but not accessing the same instance. While multiple render threads are not yet in use, this will be useful in future releases.

- Support for Effect Version greater than 7 (new max is MAJOR version 127)

Effects greater than version 7 will now report properly in 13.5 if built with the current SDK headers. It is possible to use these recompiled effects in AE versions older than 13.5, but internally the version number will wrap modulo 8 (e.g. AE will internally see effect version 8 as version 0).

This can affect the version shown in error dialog display by older AE and affect usage reporting.

Since many older plug-ins were made unloadable in AE with the shift to 64-bit, it should be unlikely this wrapping would cause ambiguity with actual plug-ins in current use (unless these plug-ins have been rapidly increasing version number over the last few years).

However, building with an older SDK and using an 8 or higher version will result in the plug-in reporting an incorrect version to AE, which will then cause mismatch with the PiPL version check for the effect which will have the higher bits set. This is not supported.

If built with an older SDK, you will need to keep the effect version at 7 or below. Increase in version max has been accomplished by adding 4 new higher significant bits to the version that only AE 13.5 and above “sees”. These new high version bits are not contiguous with the original, preexisting MAJOR version bits – just ignore the intermediate bits. The new version layout looks like this in hexadecimal or binary.

0x 3C38 0000

^^ original MAJOR version bits as a hex mask 0-7

^^ new HIGH bits extending the original MAJOR version bits 8-127

0b 0011 1100 0011 1000 0000 0000 0000 0000

^^ ^ original MAJOR version bits as a hex mask 0-7

^^ ^^ ignore / do not use

^^ ^^ new HIGH bits extend the original MAJOR version bits 8-127.

These bits are ignored in AE versions older than 13.5.

- New Installer Hints for macOS

Developers can find paths to the default location of plug-ins, scripts, and presets on macOS X in a new plist file (same as the paths in the Windows registry): `/Library/Preferences/ com.Adobe.After Effects.paths.plist`

You can use the values in this plist to direct where your installers or scripts write files, in the same way that you would use the paths keys in the registry on Windows: `HKEY_LOCAL_MACHINESOFTWAREAdobeAfter Effects13.5`

- Work In Progress

`AEGP_RenderAndCheckoutLayerFrame_Async()` `AEGP_CancelAsyncRequest()`

This APIs are in progress, and should not be used yet.

## 7.10 What’s New In CC 2014.1 (13.1)?

`PF_CreateNewAppProgressDialog()`

It won’t open the dialog unless it detects a slow render. (2 seconds timeout).

## 7.11 What’s New In CC 2014 (13.0)?

Starting in CC 2014, After Effects will now honor a change to a custom UI height made using `PF_UpdateParamUI`.

`AEGP_Effect Suite` is now at version 4, adding new functions to work with effect masks. `AEGP_RenderSuite` is now at version 4, adding a new function `AEGP_RenderAndCheckoutLayerFrame`, which allows frame checkout of the current

layer with effects applied at non-render time. This is useful for an operation that requires the frame, for example, when a button is clicked and it is acceptable to wait for a moment while it is rendering.

**Note:** Since it is not asynchronous, it will not solve the general problem where custom UI needs to draw based on the frame.

---

The layer render options are specified using the new *AEGP\_LayerRenderOptionsSuite*.

*Mercury Transmit* plug-ins and *HTML5 Panels* are now supported.

---

## 7.12 What's New In CC (12.0)?

Effect names can now be up to 47 characters long, up from 31 characters previously.

We added the *PF\_AngleParamSuite*, providing a way to get floating point values for angle parameters. *PF App Suite* version 5 adds *PF\_AppGetLanguage* to query the current language so that a plug-in can use the correct language string, as well as several new *PF\_App\_ColorType* enum values for new elements whose colors can be queried.

*AEGP Persistent Data Suite* is now at version 4, adding a new parameter to *AEGP\_GetApplicationBlob* to choose between retrieving several different application blobs. There are also new functions to get/set time and ARGB values.

*AEGP Composition Suite* is now at version 10, adding new functions to check/modify whether layer names or source names are shown, and whether the blend modes column is shown or not. Also added are new functions to get and set the Motion Blur Adaptive Sample Limit.

*AEGP Layer Suite* is now at version 8, adding new functions to set/get the layer sampling quality. *AEGP\_CanvasSuite* is also now at version 8. The new function *AEGP\_MapCompToLayerTime* handles time remapping with collapsed or nested comps, unlike *AEGP\_ConvertCompToLayerTime*.

*AEGP\_UtilitySuite* is now at version 6, adding a new Unicode-aware function: *AEGP\_ReportInfoUnicode*. Another new function, *AEGP\_GetPluginPaths*, provides some useful paths related to the plug-in and the After Effects executable itself.

The behavior for *AEGP\_NewPlaceholderFootageWithPath* has been updated, so that the *file\_type* should now be properly set, otherwise a warning will appear.

*AEGP\_InsertMenuCommand* can now insert menu items in the File>New submenu.

*AEGP\_IOInSuite* is now at version 5, adding new functions to get/set/clear the native start time, and to get/set the drop-frame setting of footage.

---

## 7.13 What's New In CS6.0.1 (11.0.1)?

New in 11.0.1, the AE effect API version has been incremented to 13.3.

This allows effects to distinguish between 11.0 and 11.0.1.

There is a bug in 11.0 with the Global Performance Cache, when a SmartFX effect uses both *PF\_OutFlag2\_AUTOMATIC\_WIDE\_TIME\_INPUT* & *PF\_OutFlag\_NON\_PARAM\_VARY*.

Calling `checkout_layer` during `PF_Cmd_SMART_PRE_RENDER` returns empty rects in `PF_CheckoutResult`.

The workaround is to simply make the call again. This workaround is no longer needed in 11.0.1.

---

## 7.14 What's New In CS6 (11.0)?

We've made several refinements for better parameter UI handling. `PF_PUI_INVISIBLE` parameter UI flag is now supported in After Effects, which is useful if your plug-in needs hidden parameters that affect rendering. Now when a plug-in disables a parameter using `PF_UpdateParamUI`, we now save that state in the UI flags so that the plug-in can check the flag in the future to see if it is disabled. A new flag, `PF_ParamFlag_SKIP_REVEAL_WHEN_UNHIDDEN`, allows a parameter to be unhidden without twirling open any parents and without scrolling the parameter into view in the Effect Controls panel and the Timeline panel.

Effects that render a watermark over the output when the plug-in is in trial mode can now tell After Effects whether watermark rendering mode is on or off, using the new `PF_OutFlag2_OUTPUT_IS_WATERMARKED`.

The new Global Performance Cache means you must tell After Effects to discard old cached frames *when changing your effect's rendering*.

We've removed `PF_HasParamChanged` and `PF_HaveInputsChangedOverTimeSpan`, providing `PF_AreStatesIdentical` instead.

Effects that provide custom UI can now receive `PF_Event_MOUSE_EXITED`, to gain notification that the mouse exited the layer or comp panel. `PF_ParamUtilsSuite` is now at version 3.

`PF_GET_PLATFORM_DATA` now has new selectors for getting the wide character path of the executable and resource file: `PF_PlatData_EXE_FILE_PATH_W` and `PF_PlatData_RES_FILE_PATH_W`. The previous non-wide selectors are now deprecated.

3D is a major theme of AE CS6. A new `AEGP_LayerFlag_ENVIRONMENT_LAYER` has been added. Many new *layer streams* were added.

Additionally, `AEGP_LayerStream_SPECULAR_COEFF` was renamed to `AEGP_LayerStream_SPECULAR_INTENSITY`, `AEGP_LayerStream_SHININESS_COEFF` was renamed to `AEGP_LayerStream_SPECULAR_SHININESS`, and `AEGP_LayerStream_METAL_COEFF` was renamed to just `AEGP_LayerStream_METAL`.

A new suite, `AEGP_RenderQueueMonitorSuite`, provides all the info a render queue manager needs to figure out what is happening at any point in a render.

`AEGP Mask Suite` is now at version 6, and provides functions to get and set the mask feather falloff type. `AEGP Mask Outline Suite` is now at version 3, and provides access to get and set mask outline feather information.

Effects that depend on masks now have a new flag available, `PF_OutFlag2_DEPENDS_ON_UNREFERENCED_MASKS`.

`AEGP Composition Suite` is now at version 9. `AEGP_CreateTextLayerInComp` and

`AEGP_CreateBoxTextLayerInComp` now have a new parameter, `select_new_layerB`.

`AEGP Render Suite` is now at version 3, adding a new function to get the GUID for a render receipt.

Finally, we have added two new read-only *Dynamic Stream* flags: `AEGP_DynStreamFlag_SHOWN_WHEN_EMPTY` and `AEGP_DynStreamFlag_SKIP_REVEAL_WHEN_UNHIDDEN`.

For effects running in Premiere Pro CS6, we have added the ability to get 32-bit float and YUV frames from `PF_CHECKOUT_PARAM`.

## 7.15 ...and what was new before CS6?

For history this far back, see obsolete copies of the SDK (which we don't provide; if someone wants you do develop for antique software, they'd best provide the SDK).

---

## How To Start Creating Plug-ins

---

### 8.1 Play!

Before you write a line of code, Spend some significant time playing with After Effects, and with the *Sample Projects*. Build the plug-ins into the right folder. Set lots of breakpoints, read the amusing and informative comments.

See a quickstart video on building an effect (on macOS): [adobe.ly/2sjMDwM](https://adobe.ly/2sjMDwM)

---

### 8.2 Plan!

Be clear on what your plug-in will attempt to do.

---

### 8.3 Hack!

After experimenting with the samples, find one that does something *like* what you want to do. The temptation to start from scratch may be strong; fight it! For effects, use the Skeleton template project. Avoid the headache of reconstructing projects (including the troublesome custom build steps for Windows PiPL resource generation) by grafting your code into an existing project.

---

## 8.4 Steal!

To make the Skeleton sample your own, copy the entire \Skeleton directory, renaming it to (for example) \WhizBang. Using your text editor of choice, search \WhizBang\*.\* (yes, that includes .NET and Xcode project files) for occurrences of Skeleton and SKELETON, and replace them with WhizBang and WHIZBANG.

You now have a compiling and running plug-in that responds to common commands, handles 8 and 16-bpc color, uses our AEGP\_SuiteHandler utility code, and responds to 3D light and camera information. There, was that so hard?

AEGP developers will do well to start with Projector (for After Effects project creation support), Easy Cheese for a keyframe assistant, IO for media file format support, and Persisto for a simple menu command and working with preferences.

---

## 8.5 Test!

If only for testing convenience, you should have a project saved with your effect applied, and all its parameters keyframed to strange values. Between these projects which stress your plug-in, and the tools provided by your development environment, you're well on your way to shipping some tested code.

---

## 8.6 Blame!

If you run into behavior that seems wrong, see if you can reproduce the behavior using one of the unmodified sample projects. This can save you a lot of time, if you can determine whether the bug behavior was introduced by your modifications, or was already there to begin with.

---

## 8.7 Developers Matter

Third party developers drive API and SDK improvement and expansion. Your products enable After Effects to do things we'd never considered. Your efforts make After Effects better; keep it up!

We work hard on the SDK, and welcome your comments and feedback. Almost every change we make to the API is suggested by developers like you. [Talk to us](#).

---

## Sample Projects

---

There is at least one sample of every type of plug-in supported by the current API, as well as projects to illustrate particular concepts.

In the sample projects, we've kept the code as simple as possible. A showy implementation might get us good grades in a programming class, but won't help you understand how to use API features.

After the break, we explain how to build the sample projects, so keep reading below!

---

### 9.1 Sample Project Descriptions

| Project     | Description  |
|-------------|--|
| AEGPs       | AEGPs hook directly into After Effects' menus and other areas in the UI. See below for specifics on where the AEGP appears in the UI.  |
| Artie       | Artie the Artisan takes over rendering of all 3D layers in a given composition. This is the same API used by our internal 3D renderers; it is very complex, and exposes a great deal of tacit information about the After Effects rendering pipeline. Unless you have a compelling reason to replace the way After Effects handles 3D rendering, you need never work with this sample. Artisans appear in Composition > Composition Settings, in the Advanced tab, in the Rendering Plug-in drop-down. |
| Easy Cheese | A keyframer (which shows up on the Animation > Keyframe Assistant submenu), Easy Cheese shows how to manipulate various characteristics of keyframes (in a way that, uncannily, resembles our shipping plug-in, Easy Ease...)  |

Continued on next page

Table 1 – continued from previous page

| Project       | Description   |
|---------------|---|
| FBIO          | Exercises the After Effects Input/Output (AEIO) API. Similar to the IO sample, but supports the frame-based .ffk file format. Note that we now recommend developing a <i>Premiere Pro Importers</i> instead.  |
| Grabba        | Gets frames (formatted as the plug-in requests) from any composition in the project.  |
| IO            | Exercises the After Effects Input/Output (AEIO) API. Supports the fictitious .fak file format, and handles all requests from After Effects for retrieving data from or outputting to such files. Note that we now recommend developing a <i>Premiere Pro Importers</i> instead.   |
| Mangler       | Mangler is a keyframer demonstrating the use of an ADM palette, just like our own.  |
| Panelator     | Creates a panel that can be docked along with the rest of the standard panels. Note: It is far more work to create a panel this way than using the HTML5 Panel SDK. We recommend starting with that SDK instead.  |
| Persisto      | Shows how to read and write information from the After Effects preferences file.  |
| ProjDumper    | Creates a text file representing every element in an After Effects project.   |
| Projector     | Imports the (fictitious) .sdk file format, and creates a project using AEGP API calls. Whenever you're wondering how to get or set some characteristic of a project element, look here first. Note: There are some hard-coded paths in Projector.h. If you don't set these to refer to actual media on disk, you WILL get errors while running this plug-in. Don't blame us; change them! |
| QueueBert     | Pronounced "Cue-BARE!", QueueBert manipulates all aspects of render queue items and the output modules associated with them.  |
| Streamie      | Manipulates streams, both dynamic and fixed.  |
| Sweetie       | Sweetie uses the PICA (or "Suite Pea") API to provide a function Suite, for use by other plug-ins. If you're writing multiple plug-ins that rely on the same image processing library, you could provide the library functionality using such a suite.  |
| Text Twiddler | Manipulates text layers and their contents.   |
| Effects       | All effects appear in the Effects & Presets panel, and in the Effect menu.  |
| Checkout      | Checks out (of After Effects' frame cache) a frame of input from another layer, at a specified time. This is an important concept for all effects with layer parameters. Premiere Pro compatible.   |
| Convolutrix   | Exercises our image convolution callbacks. Premiere Pro compatible.   |

Table 1 – continued from previous page

| <b>Project</b>         | <b>Description</b>  |
|------------------------|---|
| Gamma Table            | Shows how to manage sequence data, and uses our iteration callbacks. For nostalgia's sake, we're leaving this one sample in C; it's also compatible with many third-party plug-in hosts, due to its reliance on version 3.x API features.   |
| GLator                 | New for CC 2017. Demonstrates proper OpenGL context management in an effect plug-in.  |
| Paramarama             | Exercises wayward param types not used in other sample. Premiere Pro compatible.  |
| PathMaster             | Shows how to access paths from within an effect.  |
| Portable               | Shows how to detect and respond to several different plug-in hosts. Premiere Pro compatible.  |
| Resizer                | Resizer resizes (surprise!) the output buffer. This is useful for effects like glows and drop shadows, which would be truncated at the layer's edges if they didn't expand the output buffer. Premiere Pro compatible.  |
| SDK Backwards          | Reverses a layer's audio, and mixes it with a keyframeable sine wave.   |
| SDK Noise              | Premiere Pro compatible, demonstrates 32-bit and YUV rendering in Premiere Pro.   |
| Shifter                | Shifts an image in the output buffer, and exercises our transform_world and subpixel sampling functions.  |
| SmartyPants            | Demonstrates the SmartFX API, required for support of floating point pixels.  |
| Transformer            | Exercises our image transformation callbacks.   |
| Effect Template        |   |
| Skeleton               | Skeleton is the starting point for developing effects. Premiere Pro compatible.   |
| Effects with Custom UI |   |
| CCU                    | Implements a custom user interface in the composition and layer windows, supporting pixel aspect ratio and downsample ratios. Premiere Pro compatible.  |
| ColorGrid              | Shows how to use arbitrary data type parameters. Also has a nice custom UI. Premiere Pro compatible.  |
| Custom ECW UI          | Implements a very boring custom user interface in the effect controls window, and shows how to respond to numerous UI events.   |
| Histogram              | New for CC 2015 (13.5). An example of how custom UI can access asynchronously-rendered upstream frames for lightweight processing in CC 2015 and later. This effect calculates a sampled 10x10 color grid from the upstream frame, and displays a preview of that color grid. In render, a higher-quality grid is calculated and used to modify the output image, creating a blend of a color grid with the original image. |
| Supervisor             | Shows how to control parameters (both values and UI) based on the value of other parameters. Premiere Pro compatible.   |
| BlitHook               |   |

Table 1 – continued from previous page

| Project | Description   |
|---------|---|
| EMP     | External Monitor Preview. Use this as a starting point for adding support to output video from the composition panel to video hardware. |

## 9.2 Building The Sample Projects

We've combined the sample projects into a single master project, stored in the Examples folder of the SDK. For macOS, it is Buildall.xcodeproj; for Windows, it is BuildAll.sln.

In your IDE, you'll need to change the output folder of your project to build into After Effects' plug-in folder.

For development, we recommend using the following path for macOS: /Library/Application Support/Adobe/Common/Plug-ins/[version]/MediaCore/

Version is locked at 7.0 for all CC versions, or CSx for earlier versions.

for example: /Library/Application Support/Adobe/Common/Plug-ins/7.0/MediaCore/

or: /Library/Application Support/Adobe/Common/Plug-ins/CS6/MediaCore/

and the following path for Windows: [Program Files]\Adobe\Common\Plug-ins\[version]\MediaCore\

for example: C:\Program Files\Adobe\Common\Plug-ins\7.0\MediaCore\

or: C:\Program Files\Adobe\Common\Plug-ins\CS6\MediaCore\

Note that this Windows path is only recommended for development purposes. Windows installers should follow the guidelines here: *Where Installers Should Put Plug-ins*.

In Xcode, you can set this path once for all projects in the Xcode Preferences > Locations > Derived Data > Advanced. Under *Build Location* choose *Custom*, and fill in the path.

In Visual Studio, for convenience, we have specified the output path for all sample projects using the environment variable AE\_PLUGIN\_BUILD\_DIR. You'll need to set this as a user environment variable for your system. On Windows 7, right-click *My Computer* > *Properties*

>and in the left sidebar choose *Advanced System Settings*. In the new dialog, hit the *Environment Variables* button. In the User variables area, create a New variable named AE\_PLUGIN\_BUILD\_DIR, and with the path described above. Log out of Windows and log back in so that the variable will be set.

Alternatively, you can set output path for each project individually in Visual Studio by right-clicking a project in the Solution Explorer, choosing *Properties*, and then in *Configuration Properties* > *Linker* > *General*, set the *Output File*.

When compiling the plug-ins, if you see a link error such as:

“Cannot open file “[MediaCore plug-ins path]plugin.prm”, make sure to launch Visual Studio in administrator mode. In your Visual Studio installation, right-click devenv.exe, *Properties* > *Compatibility* > *Privilege Level*, click “Run this program as an administrator”.

---

## Debugging Plug-ins

---

The best way to learn the interaction(s) between After Effects and plug-ins is running the samples in your debugger. Spending some quality time in your compiler's debugger, and a sample project that closely resembles your plug-in, can really pay off.

Once you've got the plug-in building directly into the plug-ins folder as explained above, here's how to specify After Effects as the application to run during debug sessions:

On Windows:

- 1) In the Visual Studio solution, in the Solution Explorer panel, choose the project you want to debug
- 2) Right-click it and choose Set as StartUp Project
- 3) Right-click it again and choose Properties
- 4) In Configuration Properties > Debugging > Command, provide the path to the executable file of the host application the plug-ins will be running in (this may be After Effects or Premiere Pro)
- 5) From there you can either hit the Play button, or you can launch the application and later at any point choose Debug > Attach to Process. . .

On macOS:

- 1) In Xcode, in the Project Navigator, choose the xcodeproj you want to debug
  - 2) Choose Product > Scheme > Edit Scheme. . .
  - 3) Under Run, in the Info tab, for Executable, choose the host application the plug-ins will be running in (this may be After Effects or Premiere Pro)
  - 4) From there you can either hit the Play button to build and run the current scheme, or you can launch the application and later at any point choose Debug > Attach to Process.
-

## 10.1 Deleting Preferences

During the course of developing a plug-in, your plug-in may pass settings information to After Effects, which is then stored in its preferences file.

You may delete the preferences and restart After Effects with a clean slate by holding down Ctrl-Alt-Shift / Cmd-Opt-Shift during launch.

On Windows, the preferences are stored here: [user folder]\AppData\Roaming\Adobe\After Effects\[version]\Adobe After Effects [version]-x64 Prefs.txt

On macOS, they are stored here: ~/Library/Preferences/Adobe/After Effects/[version]/Adobe After Effects [version]-x64 Prefs

---

## Compatibility Across Multiple Versions?

---

Generally, you should compile your plug-ins with the latest After Effects SDK headers. This makes the latest suites and API functionality available to your plug-ins. When a new version of After Effects is released, you generally will not need to provide a new version unless you wish to take advantage of new functionality exposed through the new SDK. However, you should always test your plug-in in new versions of After Effects before claiming compatibility with new versions.

You should test your plug-in thoroughly in each version of After Effects supported by your plug-in. If you need to add a conditional block of code to be run only in specific versions of After Effects, you can always check the API version in *PF\_InData.version* for effects, or in the *major* and *minor\_versionL* passed into your AEGP in the *Entry Point*.

For even more precise version checking, a plug-in can run a script using *AEGP\_ExecuteScript (AEGP\_UtilitySuite6)*, querying one of the following attributes:

```
app.version - e.g. 11.0.1x12
app.buildNumber - e.g. 12.
```

## 11.1 API Versions

| Release                | Effect API Version   | AEGP API Version |
|------------------------|--|------------------|
| 15.0                   | 13.15  |                  |
| CC 2017.1 (14.2)       | 13.14  |                  |
| CC 2017 (14.0)         | 13.13  | 114.0            |
| CC 2015.3 (13.8)       | 13.11  | 113.8            |
| CC 2015 (13.7)         | 13.10  | 113.7            |
| CC 2015 (13.6)         | 13.10  |                  |
| CC 2015 (13.5, 13.5.1) | 13.9   | 113.5            |
| CC 2014 (13.0-13.2)    | 13.7   | 113              |
| CC (12.2)              | 13.6   | 112.2            |
| CC (12.1)              | 13.5   | 112.1            |
| CC (12.0)              | 13.4   | 112.0            |
| CS6.0.1 (11.0.1)       | 13.3   | 111.0            |
| CS6 (11.0)             | 13.2   | 111.0            |
| CS5.5 (10.5)           | 13.1   | 17.0             |
| CS5 (10.0)             | 13.0   | 17.0             |
| CS4 (9.0)              | 12.14  | 16.24            |
| CS3 (8.0)              | 12.13  | 16.24            |
| 7.0                    | 12.12  |                  |
| 6.5, 6.0               | 12.10 (Check for the presence of updated AEGP suites, should you need to differentiate between 6.0 and 6.5.) |                  |
| 5.0                    | 12.5   |                  |
| 4.1                    | 12.2   |                  |
| 3.1                    | 11.6   |                  |

---

## Third-party Plug-in Hosts?

---

Some developers are wary of using each After Effects release's new API features, to maintain compatibility with hosts with partial implementations. You can distinguish between host applications by checking *PF\_InData>appl\_id*. After Effects uses the *appl\_id* 'FXTC'.

Premiere Pro uses 'PrMr'. As of this writing, no third party hosts support SmartFX, or our AEGP functions.

Also, see the *Premiere Pro & Other Hosts* section.

---

## PiPL Resources

---

Originating in Adobe Photoshop over two decades ago, Plug-In Property Lists, or PiPLs, are resources which provide basic information about a plug-in's behavior, without executing the plug-in. PiPLs have been largely supplanted within After Effects by `PF_Cmd_GLOBAL_SETUP` (see *Global Selectors*) and dynamic outflags. However, for archaeological reasons, the behaviors indicated during `PF_Cmd_GLOBAL_SETUP` must agree with those in the PiPL.

A PiPL specifies the entry point of a plug-in, the display name, as well as the plug-in's match name. The match name is a unique, constant identifier, unlike a plug-in's display name, which may be changed dynamically. Starting in CC, display names can be up to 47 characters long. Previously, they were limited to 31 characters.

In the interest of cross-platform compatibility, use a single `.r` file for both macOS and Windows versions of your plug-in, like the samples do. PiPL properties must always be in macOS-specific byte order. On Windows, PiPLs are compiled by processing a `.r` file through `pippltool.exe`, which converts the `.r` file into a binary `.rc` file. The Windows sample projects all contain custom build steps which generate a `.rc` file, using a cross-platform `.r` file and our `cnvtpipl.exe` command line utility. Base your development on an existing sample plug-in and the build step will be correctly implemented.

---

### 13.1 Entry Point

Your plug-in's entry point is exported through the PiPL on Windows and macOS. If the plug-in supports multiple platforms, then multiple entry points must be defined in the PiPL. There is no need for a Windows `.def` file or manual exports, unless you're also designating some other OS-specific entry point.

The macros defined in `entry.h` (in the `\SDKExamplesHeaders` directory) take care of exporting each sample's entry point function. All the sample project entry point functions are `EffectMain()` for effects, or `EntryPointFunc()` for AEGPs.

---

## 13.2 PiPL Resources And Microsoft Visual Studio

To use resources from Microsoft Visual Studio .NET with pipltool-generated resources,

#include the output of the custom build steps into the Microsoft-generated .rc file.

```
// in file WhizBang.rc, generated by .NET.  
#include "WhizBang_PiPL_temp.rc" // pipltool.exe's output
```

If modifying a sample plug-in, change the name of the file generated by pipltool.exe to something like WhizBang\_PiPL\_temp.rc, or it will overwrite the Microsoft resources each time you build; not good.

---

## 13.3 Multiple PiPLs

It is possible, but not recommended, to include multiple plug-ins (both AEGPs and effects) in the same file, using multiple PiPLs. If there are PiPLs for both AEGPs and effects in the same file, the AEGPs must come first!

No other hosts (not even Premiere Pro) support multiple PiPLs pointing to multiple effects within the same .dll or code fragment. Also, if you need to update one plug-in, do you really want to ship a new build of all your plug-ins? We recommend one PiPL, and one plug-in, per code fragment.

---

## 13.4 Super Secret PiPL Bit

For those of you who use C++ and simply *must* keep your plug-ins loaded all the time (to avoid having your v-tables trashed, among other hazards), set the PiPL's AE\_Reserved\_Info member to 8. Over the years we've been quite stringent, insisting that plug-ins be good memory citizens and respond gracefully to getting unloaded. We know there are cases in which being unloaded with no warning can really ruin a plug-in's day (and v-tables), and so have provided this work-around. Be nice, perform scrupulous memory management, and only use your powers for good.

---

## 13.5 Why Do I Need To Know All This?

You don't; After Effects does. If you follow our advice and base your projects on the SDK samples, you can simply change the .r file containing your PiPL definition(s), and your plug-in's resources will be automatically updated the next time you build. Feel the love. Or, if you ever tinker with the custom build steps, feel the pain.

# CHAPTER 14

---

## Exceptions

---

Handle all exceptions generated by your plug-in's code, *within* your plug-in. Pass those which didn't originate in your plug-in's code to After Effects.

After Effects' APIs are designed for plug-ins written in C, and don't expect exceptions. After Effects will crash immediately if one is thrown from within a plug-in.

The effect samples use a firewall around the switch statement in the `main()` function, and the AEGPs wrap their function hooks in try/catch blocks.

---

## Where Installers Should Put Plug-ins

---

Installing your plug-ins in the common location will allow them to be loaded by Premiere Pro, if installed.

On Windows, the common plug-ins folder can be found (as an explicit path) in the following registry entry: `HKLM\SOFTWARE\Adobe\After Effects\[version]\CommonPluginInstallPath`

On Mac, the common plug-ins folder is at: `/Library/Application Support/Adobe/Common/Plug-ins/[version]/MediaCore`

Version is locked at 7.0 for all CC versions, or CSx for earlier versions. For example: `/Library/Application Support/Adobe/Common/Plug-ins/7.0/MediaCore/`

Do not use macOS aliases or Windows shortcuts, as these are not traversed by Premiere Pro.

---

### 15.1 Do I Have To Install The Plug-ins To The Common Folder?

You may have good reason to install your plug-in for only After Effects, for example, if your plug-in depends on suites and functionality not available in Premiere Pro. We strongly recommend that you use the common folder whenever possible, but for certain cases, the AE-specific plug-in folder is still available.

On Windows, the app-specific plug-ins folder can be found (as an explicit path) in the following registry entry: `\\HKEY_LOCAL_MACHINE\SOFTWARE\Adobe\After Effects\ (version) \PluginInstallPath`

On macOS, the app-specific plug-ins folder is at: `/Applications/Adobe After Effects [version]/Plug-ins/`

When launched, After Effects recursively descends 10 levels deep into subdirectories of its path. macOS aliases are traversed, but Windows shortcuts are not. Directories terminated by parentheses or preceded by the symbols `~` (macOS) or `~` (Windows) are not scanned.

Try as you might to build a fence between AE and Premiere Pro, users will still find ways to get across using our lovely integration goodness - Your effects will still be available to Premiere Pro users who create a dynamically linked AE composition with your effect, and put it in a Premiere Pro sequence.

Starting in CC, PF App Suite (*Useful Utility Functions*) adds `PF_AppGetLanguage()` to query the current language so that a plug-in can use the correct language string.

When passing strings to AE, some parts of the API accept Unicode. In other areas, for example when specifying effect parameter names during `PF_Cmd_PARAM_SETUP`, you'll need to pass the names in a char string. For these non-Unicode strings, AE interprets strings as being multi-byte encoded using the application's current locale. To build these strings, on Windows you can use the `WideCharToMultiByte()` function, specifying `CP_OEMCP` as the first argument. On macOS, use the encoding returned by `GetApplicationTextEncoding()`.

Testing with different languages in AE doesn't require an OS reinstallation, but it does require a reinstallation of AE:

For Win, change the system locale to the targeted language (control panel > region and language > administrative tab > change system locale), restart machine, and then install AE in the according language.

For Mac, set targeted language to the primary language in the preferred language list, and then install AE in the according language.

## CHAPTER 17

---

### Next Steps

---

You now have an understanding of what plug-ins are, what they can do, and how After Effects communicates with them.

Next, we will cover the *basics of effects plug-ins*.

# CHAPTER 18

---

## Effect Basics

---

This chapter will provide all the information you need to know to understand how a basic effect plug-in works.

These details are fundamental to every effect plug-in.

By the time you finish this chapter, you'll be ready for the fun stuff; modifying pixels!

---

## Entry Point

---

All communication between After Effects and an effect plug-in is initiated by After Effects, and it all happens by the host (After Effects) calling a single entry point function.

For all effect plug-ins, the entry point function must have the following signature:

```
PF_Err main (
    PF_Cmd      cmd,
    PF_InData   *in_data,
    PF_OutData  *out_data,
    PF_ParamDef *params[],
    PF_LayerDef *output,
    void        *extra)
```

The name of the entry point function above is “main”, but it can be whatever is specified in *PiPL Resources*.

Before each call to the entry point function, After Effects updates *PF\_InData* and the plug-in’s parameter array *PF\_ParamDef[]* (except as noted).

After the plug-in returns from its call, After Effects checks *PF\_OutData* for changes and, when appropriate, uses the *PF\_LayerDef* the effect has rendered.

---

## 19.1 Entry Point Function Parameters

| Argument        | Purpose  |
|-----------------|--|
| <i>cmd</i>      | After Effects sets the <i>Command Selectors</i> to tell the plug-in what to do.  |
| <i>in_data</i>  | Information about the application's state and the data the plug-in is being told to act upon. Pointers to numerous interface and image manipulation functions are also provided.   |
| <i>out_data</i> | Pass back information to After Effects by setting fields within <i>out_data</i> .  |
| <i>params</i>   | An array of the plug-in's parameters at the time provided in <i>in_data</i> 's <i>current_time</i> .<br><i>params[0]</i> is the input image (a <i>PF_EffectWorld / PF_LayerDef</i> ) to which the effect should be applied. These values are only valid during certain selectors (this is noted in the <i>selector descriptions</i> ). Parameters are discussed at length here: <i>PF_ParamDef</i> . |
| <i>output</i>   | The output image, to be rendered by the effect plug-in and passed back to After Effects. Only valid during certain selectors.  |
| <i>extra</i>    | The extra parameter varies with the command sent or (in the case of <i>PF_Cmd_EVENT</i> ) the <i>event type</i> . Used primarily for event management and <i>Parameter Supervision</i> .   |

---

## Command Selectors

---

Commands are, simply, what After Effects wants your effect to do.

Responses to some selectors are required; most are optional, though recall that we did add them for a *reason*...

With each command selector sent, effects receive information from After Effects in *PF\_InData*, input and parameter values in `PF_ParamDef[]` (an array of parameter descriptions including the input layer), and access to callbacks and function suites.

They send information back to After Effects in *PF\_OutData*, and (when appropriate) render output to a `PF_LayerDef`, also called a *PF\_EffectWorld*.

During events, they receive event-specific information in *PF\_EventExtra*.

---

### 20.1 Calling Sequence

Only the first few command selectors are predictable; the rest of the calling sequence is dictated by user action.

When first applied, a plug-in receives `PF_Cmd_GLOBAL_SETUP`, then `PF_Cmd_PARAM_SETUP`. Each time the user adds the effect to a layer, `PF_Cmd_SEQUENCE_SETUP` is sent.

For each frame rendered by a basic non-SmartFX effect, After Effects sends `PF_Cmd_FRAME_SETUP`, then `PF_Cmd_RENDER`, then `PF_Cmd_FRAME_SETDOWN`.

All effect plug-ins must respond to `PF_Cmd_RENDER`

For SmartFX, `PF_Cmd_SMART_PRE_RENDER` may be sent any number of times, before a single `PF_Cmd_SMART_RENDER` is sent.

`PF_Cmd_SEQUENCE_SETDOWN` is sent on exit, when the user removes an effect or closes the project. `PF_Cmd_SEQUENCE_RESETUP` is sent when a project is loaded or when the layer to which it's applied changes. `PF_Cmd_SEQUENCE_FLATTEN` is sent when the After Effects project is written out to disk.

`PF_Cmd_ABOUT` is sent when the user chooses *About...* from the Effect Controls Window (ECW).

PF\_Cmd\_GLOBAL\_SETDOWN is sent when After Effects closes, or when the last instance of the effect is removed. Do not rely on this message to determine when your plug-in is being removed from memory; use OS-specific entry points.

## 20.2 Command Selectors Table

### 20.2.1 Global Selectors

All plug-ins must respond to these selectors.

| Selector            | Response  |
|---------------------|---|
| PF_Cmd_ABOUT        | Display a dialog describing the plug-in. Populate out_data>return_msg and After Effects will display it in a simple modal dialog.<br>Include your plug-in's version information in the dialog. On macOS, the current resource file will be set to your effects module during this selector. |
| PF_Cmd_GLOBAL_SETUP | Set any required flags and PF_OutData fields (including out_data>my_version) to describe your plug-in's behavior.   |
| PF_Cmd_GLOBAL_FREE  | Free all global data (only required if you allocated some).   |
| PF_Cmd_PARAMETERS   | Describe your parameters and register them using <i>PF_ADD_PARAM</i> .<br>Also, register custom user interface elements.<br>Set <i>PF_OutData&gt;num_params</i> to match your parameter count.  |

### 20.2.2 Sequence Selectors

These control sequence data handling.

| Selector                         | Response  |
|----------------------------------|---|
| PF_Cmd_SEQUENCE_SETUP            | Allocate and initialize any sequence-specific data. Sent when the effect is first applied. <i>PF_InData</i> is initialized at this time.  |
| PF_Cmd_SEQUENCE_FLATTEN          | Recreate (usually unflat) sequence data. Sent after sequence data is read from disk, during pre-composition, or when the effect is copied;<br>After Effects flattens sequence data before duplication. During duplication, PF_Cmd_SEQUENCE_RESETUP is sent for both the old and new sequences.<br>Don't expect a PF_Cmd_SEQUENCE_FLATTEN between PF_Cmd_SEQUENCE_RESETUPs.  |
| PF_Cmd_SEQUENCE_SAVE_AND_FLATTEN | Save when saving and flatten when duplicating the sequence. Flatten sequence data containing pointers or handles so it can be written to disk.<br>This will be saved with the project file. Free the unflat data and set the out_data>sequence_data to point to the new flattened data. Flat data must be correctly byte-ordered for file storage.<br>As of 6.0, if an effect's sequence data has recently been flattened, the effect may be deleted without receiving an additional PF_Cmd_SEQUENCE_SETDOWN.<br>In this case, After Effects will dispose of your flat sequence data. |
| PF_Cmd_SEQUENCE_SETDOWN          | Free all sequence data.   |

### 20.2.3 Frame Selectors

Passed for each frame (or set of audio samples) to be rendered by your plug-in.

| Selector                | Response   |
|-------------------------|--|
| PF_Cmd_FRAME_SETUP      | <p>Allocate any frame-specific data. This is sent immediately before each frame is rendered, to allow for frame-specific setup data. If your effect changes the size of its output buffer, specify the new output height, width, and relative origin. All parameters except the input layer are valid.</p> <p>If you set width and height to 0, After Effects ignores your response to the following <i>PF_Cmd_RENDER</i>.</p> <p>NOTE: If <i>PF_Outflag_I_EXPAND_BUFFER</i> is set, you will receive this selector (and <i>PF_Cmd_FRAME_SETDOWN</i>) twice, once without <i>PF_Cmd_RENDER</i> between them.</p> <p>This is so we know whether or not the given layer will be visible.</p> <p>Frame data dates from the days when machines might have 8MB of RAM. Given the calling sequence (above), it's much more efficient to just allocate during <i>PF_Cmd_RENDER</i>.</p> |
| PF_Cmd_RENDER           | <p>Render the effect into the output, based on the input frame and any parameters.</p> <p>This render call can only support 8-bit or 16-bit per channel rendering. 32-bit per channel rendering must be handled in <i>PF_Cmd_SMART_RENDER</i>.</p> <p>All fields in <i>PF_InData</i> are valid.</p> <p>If your response to this selector is interrupted (your calls to <i>PF_ABORT</i> or <i>PF_PROGRESS</i> returns an error code), your results will not be used.</p> <p>You cannot delete <i>frame_data</i> during this selector; you must wait until <i>PF_Cmd_FRAME_SETDOWN</i>.</p>  |
| PF_Cmd_FRAME_SETDOWN    | <p>Free any frame data allocated during <i>PF_Cmd_FRAME_SETUP</i>.</p>   |
| PF_Cmd_AUDIO_SETUP      | <p>Sent before every audio render. Request a time span of input audio. Allocate and initialize any sequence-specific data.</p> <p>If your effect requires input from a time span other than the output time span, update the <i>startsampL</i> and <i>endsampL</i> field in <i>PF_OutData</i>.</p>   |
| PF_Cmd_AUDIO_RENDER     | <p>Populate <i>PF_OutData.dest_snd</i> with effect-ed audio. All fields in <i>PF_InData</i> are valid.</p> <p>If your response to this selector is interrupted (your calls to <i>PF_ABORT</i> or <i>PF_PROGRESS</i> returns an error code), your results will not be used.</p>   |
| PF_Cmd_AUDIO_SETDOWN    | <p>Free memory allocated during <i>PF_Cmd_AUDIO_SETUP</i>.</p>   |
| PF_Cmd_SMART_PRE_RENDER | <p>SmartFX only. Identify the area(s) of input the effect will need to produce its output, based on whatever criteria the effect implements.</p> <p>maybe sent up to twice when MediaCore is hosting. The first will come during <i>GetFrameDependencies</i> to collect the inputs.</p> <p>The source checkouts can return full frame dimensions here. Once the sources are rendered, if they are different in size than the first call then this selector will be emitted a second time with the actual source sizes in order to get a correct output size.</p>   |

20.2. Command Selectors Table

Note that MediaCore wants all of the output, so *PF\_PreRenderOutput::max\_result\_rect* will be used.

**New in 16.0**

## 20.2.4 Messaging

The communication channel between After Effects and your plug-in.

| Selector                  | Response  |
|---------------------------|---|
| PF_Cmd_EVENT              | <p>This selector makes use of the extra parameter; the type of event to be handled is indicated by the <code>e_type</code> field, a member of the structure pointed to by <code>extra</code>.<br/>See <i>Effect UI &amp; Events</i>.</p>  |
| PF_Cmd_USER_CHANGED_PARAM | <p>The user changed a parameter value. You will receive this command only if you've set the <code>PF_ParamFlag_SUPERVISE</code> flag.<br/>You modify the parameter to control values, or make one parameter's value affect others. A parameter can be modified by different actions.<br/><code>in_data.current_time</code> is set to the time of the frame that the user is looking at in the UI (internally, the current time of the comp converted into layer time) while they are changing the param that triggered the <code>PF_Cmd_USER_CHANGED_PARAM</code>.<br/>It's also the time of a keyframe that is added automatically (if there isn't one already, and the stopwatch is enabled).<br/>This is usually the same as the value passed for the <code>PF_Cmd_RENDER</code> that follows immediately after (unless caps lock is down), but not necessarily – there could be other comp windows open that cause a render at a different time in response to the changed param.</p> |
| PF_Cmd_UPDATE_PARAMS_UI   | <p>The effect controls palette (ECP) needs to be updated. This might occur after opening the ECP or moving to a new time within the composition.<br/>You can modify parameter characteristics (enabling or disabling them, for example) by calling <code>PF_UpdateParamUI()</code>.<br/>Only cosmetic changes may be made in response to this command. Don't change parameter values while responding to <code>PF_Cmd_UPDATE_PARAMS_UI</code>; do so during <code>PF_Cmd_USER_CHANGED_PARAM</code> instead.<br/>This command will only be sent regularly if <code>PF_OutFlag_SEND_UPDATE_PARAMS_UI</code> was set in the PiPL, and during <code>PF_Cmd_GLOBAL_SETUP</code>.<br/>NOTE: Never check out parameters during this selector. Recursive badness is almost guaranteed to result.</p>  |
| PF_Cmd_DO_DIALOG          | <p>Display an options dialog. this is sent when the Options button is clicked (or a menu command has been selected).<br/>This selector will only be sent if the effect has previously indicated that it has a dialog (by setting the global <code>PF_OutFlag_I_DO_DIALOG</code> flag in response to <code>PF_Cmd_GLOBAL_SETUP</code>).<br/>In version 3.x, the params passed with <code>PF_Cmd_DO_DIALOG</code> were invalid.<br/>This is no longer the case; plug-ins can access non-layer parameters, check out parameters at other times, and perform UI updates during <code>PF_Cmd_DO_DIALOG</code>.<br/>They still may not change the parameter's values.</p>   |
| PF_Cmd_ARBITRARY_CALLBACK | <p>Manage your arbitrary data type. You'll only receive this if you've registered a custom data type parameter. The extra parameter indicates which handler function is</p>   |

**20.2. Command Selectors Table**

|                                  |  |              |
|----------------------------------|--|--------------|
| PF_Cmd_GET_EXTERNAL_DEPENDENCIES | Only sent if <code>PF_OutFlag_I_HAVE_EXTERNAL_DEP</code> | DEPENDENCIES |
|----------------------------------|--|--------------|

being called.  
Custom data types are discussed further in *Implementing Arbitrary Data*.

## 20.3 What's The Difference?

There is a subtle difference between `PF_Cmd_USER_CHANGED_PARAM` and `PF_Cmd_UPDATE_PARAMS_UI`.

Effects need to distinguish between the user actually changing a parameter value (`PF_Cmd_USER_CHANGED_PARAM`), and just scrubbing around the timeline (`PF_Cmd_UPDATE_PARAMS_UI`), which is also sent when the plug-in is first loaded).

Only the first few command selectors are predictable; the rest of the calling sequence is dictated by user action.

When first applied, a plug-in receives `PF_Cmd_GLOBAL_SETUP`, then `PF_Cmd_PARAM_SETUP`. Each time the user adds the effect to a layer, `PF_Cmd_SEQUENCE_SETUP` is sent.

For each frame rendered by a basic non-SmartFX effect, After Effects sends `PF_Cmd_FRAME_SETUP`, then `PF_Cmd_RENDER`, then `PF_Cmd_FRAME_SETDOWN`. All effect plug-ins must respond to `PF_Cmd_RENDER`.

For SmartFX, `PF_Cmd_SMART_PRE_RENDER` may be sent any number of times, before a single `PF_Cmd_SMART_RENDER` is sent.

`PF_Cmd_SEQUENCE_SETDOWN` is sent on exit, when the user removes an effect or closes the project. `PF_Cmd_SEQUENCE_RESETUP` is sent when a project is loaded or when the layer to which it's applied changes. `PF_Cmd_SEQUENCE_FLATTEN` is sent when the After Effects project is written out to disk.

`PF_Cmd_ABOUT` is sent when the user chooses *About...* from the Effect Controls Window (ECW).

`PF_Cmd_GLOBAL_SETDOWN` is sent when After Effects closes, or when the last instance of the effect is removed. Do not rely on this message to determine when your plug-in is being removed from memory; use OS-specific entry points.

## PF\_InData

After Effects communicates system, project, layer and audio information using PF\_InData. This structure is updated before each command selector is sent to a plug-in.

Fields valid only during specific *PF\_Cmds* are noted.

Also, don't worry; although PF\_InData is dauntingly large, you need not memorize each member's purpose; you'll use some of the fields some of the time.

## 21.1 PF\_InData Members

| Name       | Description   |
|------------|---|
| inter      | Callbacks used for user interaction, adding parameters, checking whether the user has interrupted the effect, displaying a progress bar, and obtaining source frames and parameter values at times other than the current time being rendered.<br>This very useful function suite is described in <i>Interaction Callback Functions</i> . |
| utils      | Graphical and mathematical callbacks. This pointer is defined at all times.   |
| effect_ref | Opaque data that must be passed to most of the various callback routines.<br>After Effects uses this to identify your plug-in.  |

Continued on next page

Table 1 – continued from previous page

| Name         | Description   |
|--------------|---|
| quality      | <p>The current quality setting, either PF_Quality_HI or PF_Quality_LO.</p> <p>Effects should perform faster in LO, and more accurately in HI.</p> <p>The graphics utility callbacks perform differently between LO and HI quality; so should your effect!</p> <p>This field is defined during all frame and sequence selectors.</p>   |
| version      | <p>Effects specification version, Indicate the version you need to run successfully during PF_Cmd_GLOBAL_SETUP.</p>   |
| serial_num   | <p>The serial number of the invoking application.</p>   |
| appl_id      | <p>The identifier of the invoking application.</p> <p>If your plug-in is running in After Effects, appl_id contains the application creator code 'FXTC'.</p> <p>If it is running in <i>Premiere Pro &amp; Other Hosts</i> it will be 'PrMr'.</p> <p>Use this to test whether your plug-in, licensed for use with one application, is being used with another.</p>   |
| num_params   | <p>Input parameter count.</p>   |
| what_cpu     | <p>Under macOS this contains the Gestalt value for CPU type (see Inside Macintosh, volume 6). Undefined on Windows.</p>   |
| what_fpu     | <p>Under macOS this contains the Gestalt value for FPU type.</p> <p>Undefined on Windows.</p>   |
| current_time | <p>The time of the current frame being rendered, valid during PF_Cmd_RENDER. This is the current time in the layer, not in any composition. If a layer starts at other than time 0 or is time-stretched, layer time and composition time are distinct.</p> <p>The current frame number is current_time divided by time_step. The current time in seconds is current_time divided by time_scale.</p> <p>To handle time stretching, composition frame rate changes, and time remapping, After Effects may ask effects to render at non-integral times (between two frames).</p> <p>Be prepared for this; don't assume that you'll only be asked for frames on frame boundaries.</p> <p>NOTE: As of CS3 (8.0), effects may be asked to render at negative current times. Deal!</p> |

Continued on next page

Table 1 – continued from previous page

| Name            | Description  |
|-----------------|--|
| time_step       | <p>The duration of the current source frame being rendered. In several situations with nested compositions, this source frame duration may be different than the time span between frames in the layer (<code>local_time_step</code>).</p> <p>This value can be converted to seconds by dividing by <code>time_scale</code>.</p> <p>When calculating other source frame times, such as for <code>PF_CHECKOUT_PARAM</code>, use this value rather than <code>local_time_step</code>.</p> <p>Can be negative if the layer is time-reversed. Can vary from one frame to the next if time remapping is applied on a nested composition.</p> <p>Can differ from <code>local_time_step</code> when source material is stretched or remapped in a nested composition. For example, this could occur when an inner composition is nested within an outer composition with a different frame rate, or time remapping is applied to the outer composition.</p> <p>This value will be 0 during <code>PF_Cmd_SEQUENSE_SETUP</code> if it is not constant for all frames.</p> <p>It will be set correctly during <code>PF_Cmd_FRAME_SETUP</code> and <code>PF_Cmd_FRAME_SETDOWN</code> selectors.</p> <p><b>WARNING:</b> This can be zero, so check it before you divide.</p> |
| total_time      | <p>Duration of the layer.</p> <p>If the layer is time-stretched longer than 100%, the value will be adjusted accordingly; but if the layer is time-stretched shorter, the value will not be affected.</p> <p>If time remapping is enabled, this value will be the duration of the composition.</p> <p>This value can be converted to seconds by dividing by <code>time_scale</code>.</p>   |
| local_time_step | <p>Time difference between frames in the layer. Affected by any time stretch applied to a layer.</p> <p>Can be negative if the layer is time-reversed.</p> <p>Unlike <code>time_step</code>, this value is constant from one frame to the next.</p> <p>This value can be converted to seconds by dividing by <code>time_scale</code>.</p> <p>For a step value that is constant over the entire frame range of the layer, use <code>local_time_step</code>, which is based on the composition's framerate and layer stretch.</p>  |

Continued on next page

Table 1 – continued from previous page

| Name            | Description   |
|-----------------|---|
| time_scale      | <p>The units per second that <code>current_time</code>, <code>time_step</code>, <code>local_time_step</code> and <code>total_time</code> are in.</p> <p>If <code>time_scale</code> is 30, then the units of <code>current_time</code>, <code>time_step</code>, <code>local_time_step</code> and <code>total_time</code> are in 30ths of a second.</p> <p>The <code>time_step</code> might then be 3, indicating that the sequence is actually being rendered at 10 frames per second. <code>total_time</code> might be 105, indicating that the sequence is 3.5 seconds long.</p> |
| field           | <p>Valid only if <code>PF_OutFlag_PIX_INDEPENDENT</code> was set during <code>PF_Cmd_GLOBAL_SETUP</code>.</p> <p>Check this field to see if you can process just the upper or lower field.</p>  |
| shutter_angle   | <p>Motion blur shutter angle. Values range from 0 to 1, which represents 360 degrees.</p> <p>Will be zero unless motion blur is enabled and checked for the target layer.</p> <p><code>shutter_angle == 180</code> means the time interval between <code>current_time</code> and <code>current_time + 1/2 time_step</code>.</p> <p>Valid only if <code>PF_OutFlag_I_USE_SHUTTER_ANGLE</code> was set during <code>PF_Cmd_GLOBAL_SETUP</code>.</p> <p>See the section on <i>Motion Blur</i> for details on how to implement motion blur in your effect.</p>                        |
| width           | <p>Dimensions of the source layer, which are not necessarily the same as the width and height fields in the input image parameter.</p> <p>Buffer resizing effects can cause this difference. Not affected by downsampling.</p>  |
| height          |   |
| extent_hint     | <p>The intersection of the visible portions of the input and output layers; encloses the composition rectangle transformed into layer coordinates.</p> <p>Iterating over only this rectangle of pixels can speed your effect dramatically. See <i>extent_hint Usage</i> later in this chapter regarding proper usage.</p>   |
| output_origin_x | <p>The origin of the output buffer in the input buffer. Non-zero only when the effect changes the origin.</p>   |
| output_origin_y |   |

Continued on next page

Table 1 – continued from previous page

| Name                       | Description  |
|----------------------------|--|
| downsample_x               | <p>Point control parameters and layer parameter dimensions are automatically adjusted to compensate for a user telling After Effects to render only every nth pixel. Effects need the downsampling factors to interpret scalar parameters representing pixel distances in the image (like sliders).</p> <p>For example, a blur of 4 pixels should be interpreted as a blur of 2 pixels if the downsample factor is 1/2 in each direction (downsample factors are represented as ratios.)</p> <p>Valid only during</p> <ul style="list-style-type: none"> <li>• <i>PF_Cmd_SEQUENCE_SETUP</i>,</li> <li>• <i>PF_Cmd_SEQUENCE_RESETUP</i>,</li> <li>• <i>PF_Cmd_FRAME_SETUP</i>,</li> <li>• <i>PF_Cmd_RENDER</i></li> </ul> |
| downsample_y               |  |
| pixel_aspect_ratio         | Pixel aspect ratio (width over height).  |
| in_flags                   | Unused.  |
| global_data                | Data stored by your plug-in during other selectors. Locked and unlocked by After Effects before and after calling the plug-in.   |
| sequence_data              |  |
| frame_data                 |  |
| start_sampL                | Starting sample number, relative to the start of the audio layer.  |
| dur_sampL                  | Duration of audio, expressed as the number of samples. Audio-specific.   |
| total_sampL                | Samples in the audio layer; equivalent to total_time expressed in samples.   |
| src_snd                    | PF_SoundWorld describing the input sound. Audio-specific.  |
| pica_basicP                | Pointer to the PICA Basic suite, used to acquire other suites.   |
| pre_effect_source_origin_x | <p>Origin of the source image in the input buffer. Valid only when sent with a frame selector.</p> <p>Non-zero only if one or more effects that preceded this effect on the same layer resized the output buffer and moved the origin.</p> <p>Check for both the resize and the new origin to determine output area.</p> <p>This is useful for effects which have implicit spatial operations (other than point controls), like flipping a file around an image's center.</p> <p>NOTE: Checked-out point parameters are adjusted for the pre-effect origin at the current time, not the time being checked out.</p>  |
| pre_effect_source_origin_y |  |
| shutter_phase              | Offset from frame time to shutter open time as a percentage of a frame duration.   |

## 21.2 extent\_hint Usage

---

**Note:** hint rectangles are much more effective... and complicated... for *SmartFX*.

---

Use `extent_hint` to process only those pixels for which output is required; this is one of the simplest optimizations you can make.

Tell After Effects you use `in_data>extent_hint` by setting `PF_OutFlag_USE_OUTPUT_EXTENT` in `PF_OutData` during `PF_Cmd_GLOBAL_SETUP` (and in your PiPL).

Disable caching from the preferences menu before testing `extent_hint` code, so After Effects renders your effect whenever anything in your composition changes.

Otherwise, the caching mechanism would obscure your plug-in's (possibly incorrect) output.

Move the layer within the composition so it's cropped. The `output>extent_hint` is the portion of the layer which is visible in the composition.

Add a mask to your layer and move it around.

This changes the `extent_hint`, which encloses all of the non-zero alpha areas of the image.

The `in_data>extent_hint` is the intersection of these two rectangles (the composition and the mask), and changes whenever they do.

Extent rectangles are computed in the coordinate space of the original input layer, before resizing and origin shifting, to simplify rectangle intersection between the input and output extents for effects which set `PF_OutFlag_PIX_INDEPENDENT`.

To get the output extent in the coordinate system of the output buffer, offset the `extent_hint` by the `PF_InData->output_origin_x` and `y` fields.

Account for downsampling when computing output size; users must be able to render at full resolution.

If the output buffer exceeds 30,000 by 30,000, clamp it to that size, and consider displaying an alert dialog.

Once your code behaves correctly, enable the cache and see how frequently the effect needs to re-render.

Consider a drop shadow; users frequently apply a static drop shadow to a still image.

The `output>extent_hint` is ignored, so the cache is used more often.

For buffer-expanding effects, intersect the `output>extent_hint` with your plug-in's transformed bounds and sets the size accordingly during `PF_Cmd_FRAME_SETUP`.

---

## 21.3 Now with 20% More Pixels!

As of 6.0, the `extent_hints` passed are 20% larger than the layer itself, to help with our predictive rendering decisions.

Numerous effects expand the buffer "just a touch", and After Effects often uses the hint rectangles later.

---

## 21.4 Point Controls And Buffer Expansion

Effects which expand the output buffer position the original layer's upper left corner by setting `output_origin_x/y` in `PF_InData` during `PF_Cmd_FRAME_SETUP`.

This shift is reported to subsequent effects in the `pre_effect_source_origin_x/y`. Point parameters are adjusted for this shift automatically.

Apply a buffer expander such as Gaussian Blur or the Resizer SDK sample, *before* your effect, and use a large resize value.

If your effect is not handling `pre_effect_source_origin_x/y` correctly, turning the blur on and off will shift the position of the output.

All point parameter values (at any time) have shift values described by `pre_effect_source_origin_x/y`. For most effects this works transparently.

However, if a buffer expansion changes over time (as with an animated blur amount), the origin shift will move non-animated points.

Consider this when designing effects which cache point parameter values between frames.

## CHAPTER 22

---

### PF\_OutData

---

Communicate changes made by your plug-in to After Effects using PF\_OutData. Valid times for altering these fields are noted.

---

## 22.1 PF\_OutData Members

| Field   | Description  |
|---|--|
| <code>my_version</code>   | Set this flag (using the <code>PF_VERSION</code> macro) to the version of your plug-in code. After Effects uses this data to decide which of duplicate effects to load.  |
| <code>name</code>   | Unused.  |
| <code>global_data</code>  | Handle which will be returned to you in <i>PF_InData</i> with every call. Use After Effects' memory allocation functions.  |
| <code>num_params</code>   | After Effects checks this field against the number of calls made to <code>PF_ADD_PARAM</code> , as well as the implicit input layer.   |
| <code>sequence_data</code>  | Allocatable upon receiving <i>PF_Cmd_SEQUENSE_SETUP</i> , this handle will be passed back to you in <i>PF_InData</i> during all subsequent calls.  |
| <code>flat_sdata</code>   | Unused (After Effects knows the size, because you used its allocation functions to get the memory in the first place).   |
| <code>frame_data</code>   | Handle you (might have) allocated during <i>PF_Cmd_FRAME_SETUP</i> . This is never written to disk; it was used to pass information from your <i>PF_Cmd_FRAME_SETUP</i> response to your <i>PF_Cmd_RENDER</i> or <i>PF_Cmd_FRAME_SETDOWN</i> (which you must do if you resize the output buffer). Otherwise, this memory is rarely used. |
| <code>width</code> ,<br><code>height</code> ,<br><code>origin</code>              | Set during <i>PF_Cmd_FRAME_SETUP</i> if the output image size differs from the input. <code>width</code> and <code>height</code> are the size of the output buffer, and <code>origin</code> is the point the input should map to in the output. To create a 5-pixel drop shadow up and left, set <code>origin</code> to (5, 5).          |
| <code>out_flags</code>  | Send messages to After Effects. OR together multiple values.   |
| <code>return_msg</code>   | After Effects displays any C string you put here (checked and cleared after every command selector).   |
| <code>start_sample</code> ,<br><code>dur_sample</code> ,<br><code>dest_snd</code> | Used only for <i>Audio</i> commands  |
| <code>out_flags2</code>   | Send messages to After Effects. OR together multiple values.   |

## 22.2 PF\_OutFlags

These flags communicate capability and status information to After Effects. In previous versions they were also used to send rudimentary messages, e.g. refresh the UI, send an error message.

These capabilities have been supplanted by function suites, and all new messaging functions will come in that format. However, capability flags are still contained in the *PiPL*.

Update both the *PiPL* and your source code when you make a change. Many of these flags can be changed during an After Effects session.

| Flag                                      | Indicates  |
|---|--|
| PF_OutFlag_KEEP_RESOURCE_OPEN             | <p>The plug-in's resources must be available during all commands.</p> <p>During <i>PF_Cmd_GLOBAL_SETUP</i>, the plug-in's resources are always open, but unavailable at all other times (except during <i>PF_Cmd_ABOUT</i> and <i>PF_Cmd_DO_DIALOG</i>), unless this flag has been set.</p> <p>Set if you need access to resources at any time other than during <i>PF_Cmd_GLOBAL_SETUP</i>.</p> <p>NOTE: We recommend the plug-in load and store the necessary resources in global data, rather than keeping the file's resources open.</p>   |
| PF_OutFlag_WIDE_TIME_INPUT                | <p>The effect checks out a parameter at a time other than <i>current_time</i>.</p> <p>If you use a parameter (including layer parameters) from another time, set this flag.</p> <p>Otherwise, After Effects won't correctly invalidate cached frames used by your effect.</p> <p>Set during <i>PF_Cmd_GLOBAL_SETUP</i>.</p> <p>If you set this flag, we strongly recommend you also set <i>PF_OutFlag2_AUTOMATIC_WIDE_TIME_INPUT</i> for better performance.</p>   |
| PF_OutFlag_NON_PARAM_VARY                 | <p>With this flag set, After Effects will not cache output when the effect is applied to a still.</p> <p>Otherwise, After Effects will cache your output to be used to render other frames, if possible.</p> <p>Set this flag if output varies based on something besides a parameter value.</p> <p>If the effect produces changing frames when applied to a still image and all parameters are constant, that's a sure sign that this bit should be set (e.g. Wave Warp).</p> <p>Particle effects, for example, will need this.</p> <p>Set during <i>PF_Cmd_GLOBAL_SETUP</i>.</p> <p>Can be overridden dynamically if needed during <i>PF_Cmd_QUERY_DYNAMIC_FLAGS</i>.</p> <p>Turn this off whenever possible to improve performance.</p> |
| PF_OutFlag_RESERVED6                      | <p>Unused. <span style="float: right;">Formerly</span></p> <p><i>PF_OutFlag_SEND_PARAMS_UPDATE</i>. <span style="float: right;">Replaced</span></p> <p>by <i>PF_OutFlag_REFRESH_UI</i>.</p>  |
| PF_OutFlag_SEQUENCE_DATA_NEEDS_FLATTENING | <p>Both After Effects and Premiere Pro assume this flag is set.</p> <p>Flattening is necessary when sequence data contains referencing items (pointers, handles), which must be flattened for storage and unflattened for use.</p> <p>See <i>PF_Cmd_SEQUENCE_RESETUP</i>.</p>  |

Continued on next page

Table 1 – continued from previous page

| Flag                             | Indicates  |
|----------------------------------|--|
| PF_OutFlag_I_DO_DIALOG           | <p>Effect displays a dialog in response to <i>PF_Cmd_DO_DIALOG</i>.</p> <p>Set during <i>PF_Cmd_GLOBAL_SETUP</i>, checked during <i>PF_Cmd_SEQUENCE_SETUP</i>.</p> <p>Note: the effect's response to PF_OutFlag_I_DO_DIALOG is not undoable. You can use arbitrary data with a custom UI, should such changes become necessary.</p>  |
| PF_OutFlag_USE_OUTPUT_EXTENT     | <p>Effect honors the output <code>extent_rect</code>. Set during <i>PF_Cmd_GLOBAL_SETUP</i>.</p> <p>See details at the end of the chapter for proper usage.</p> <p>Note: Obsolete for SmartFX.</p>   |
| PF_OutFlag_SEND_DO_DIALOG        | <p>Effect must show dialog to function (added for compatibility with Photoshop plug-ins).</p> <p>After Effects sends <i>PF_Cmd_DO_DIALOG</i> after <i>PF_Cmd_SEQUENCE_SETUP</i>.</p> <p>Set during <i>PF_Cmd_SEQUENCE_RESETUP</i>, not during <i>PF_Cmd_GLOBAL_SETUP</i>.</p>  |
| PF_OutFlag_DISPLAY_ERROR_MESSAGE | <p>Display the contents of <code>return_msg</code> in an error dialog.</p> <p>Whenever <code>return_msg</code> is non-NULL, After Effects displays the contents in a dialog, which will be an error dialog if this flag is set.</p> <p>Set after any command, and can be used during debugging.</p> <p>This is also a good way to implement nag messages for tryout versions.</p>  |
| PF_OutFlag_I_EXPAND_BUFFER       | <p>Effect expands the output buffer.</p> <p>Set during <i>PF_Cmd_GLOBAL_SETUP</i>.</p> <p>Set this flag and <code>PF_OutFlag_USE_OUTPUT_EXTENT</code> to use the intersection of the output <code>extent_rect</code> and your new buffer size during <i>PF_Cmd_FRAME_SETUP</i>.</p> <p>Use <code>pre_effect_source_origin</code> fields to detect other transformations.</p> <p>Note: Only set this flag if you need to; it drastically reduces caching efficiency.</p> <p>Note: Obsolete for SmartFX.</p> |
| PF_OutFlag_PIX_INDEPENDENT       | <p>A given pixel is independent of the pixels around it.</p> <p>Set during <i>PF_Cmd_GLOBAL_SETUP</i> or <i>PF_Cmd_QUERY_DYNAMIC_FLAGS</i>.</p> <p>As an example, color correction effects are typically pixel independent, distortions are not.</p> <p>NOTE: If your effect doesn't use the color values of one pixel to affect those of adjacent pixels, set this outflag! It can provide dramatic performance improvements.</p>   |
| PF_OutFlag_I_WRITE_INPUT_BUFFER  | <p>The effect writes into the input buffer.</p> <p>This is of limited use; while saving an allocation, it invalidates some pipeline caching. Set during <i>PF_Cmd_GLOBAL_SETUP</i>.</p>  |

Table 1 – continued from previous page

| Flag                                    | Indicates   |
|---|---|
| PF_OutFlag_I_SHRINK_BUFFER              | The effect shrinks its buffer based on the <code>extent_rect</code> in order to be more memory efficient.<br>Set during <code>PF_Cmd_GLOBAL_SETUP</code> whenever possible.<br>Note: Obsolete for SmartFX.  |
| PF_OutFlag_WORKS_IN_PLACE               | Unused.   |
| PF_OutFlag_SQUARE_PIX_ONLY              | Unused.   |
| PF_OutFlag_CUSTOM_UI                    | The effect has a custom user interface and requires <code>PF_Cmd_EVENT</code> messages.<br>Set during <code>PF_Cmd_GLOBAL_SETUP</code> .  |
| PF_OutFlag_RESERVED5                    | Unused.   |
| PF_OutFlag_REFRESH_UI                   | Refresh the entire effect controls, composition, and layer windows.<br>Set during <code>PF_Cmd_EVENT</code> , <code>PF_Cmd_RENDER</code> , and <code>PF_Cmd_DO_DIALOG</code> .<br>If refreshing custom UI during <code>PF_Cmd_EVENT</code> , we recommend using the <i>new redraw mechanism</i> with finer granularity. |
| PF_OutFlag_NOP_RENDER                   | Set this flag during <code>PF_Cmd_FRAME_SETUP</code> to invalidate the current render.  |
| PF_OutFlag_I_USE_SHUTTER_ANGLE          | Indicates rendered images depend upon the value of <code>shutter_angle</code> .   |
| PF_OutFlag_I_USE_AUDIO                  | Effect's parameters depend on audio data, obtained using <code>PF_CHECKOUT_LAYER_AUDIO</code> .   |
| PF_OutFlag_I_AM_OBSOLETE                | Effect is available for use when working with an old project in which it was originally applied, but doesn't appear in the effect menu.   |
| PF_OutFlag_FORCE_RERENDER               | Effect made a change that requires a re-render.<br><code>PF_ChangeFlag_CHANGED_VALUE</code> also forces a re-render.  |
| PF_OutFlag_PiPL_OVERRIDES_OUTDATA_OUTFL | After Effects will use PiPL outflags, and ignore those set during <code>PF_Cmd_GLOBAL_SETUP</code> .  |
| PF_OutFlag_I_HAVE_EXTERNAL_DEPENDENCIES | Effect depends on an external file (or external font).<br>If set, After Effects sends <code>PF_Cmd_GET_EXTERNAL_DEPENDENCIES</code> .   |
| PF_OutFlag_DEEP_COLOR_AWARE             | The effect handles 16-bpc color.  |
| PF_OutFlag_SEND_UPDATE_PARAMS_UI        | Set this flag during <code>PF_Cmd_GLOBAL_SETUP</code> to receive <code>PF_Cmd_UPDATE_PARAMS_UI</code> .   |
| PF_OutFlag_AUDIO_FLOAT_ONLY             | Effect requires audio data in <code>PF_SIGNED_FLOAT</code> format.<br>After Effects will perform any required format conversion.<br>You must also set either <code>PF_OutFlag_AUDIO_EFFECT_TOO</code> or <code>PF_OutFlag_AUDIO_EFFECT_ONLY</code> .  |

Continued on next page

Table 1 – continued from previous page

| Flag                          | Indicates  |
|-------------------------------|--|
| PF_OutFlag_AUDIO_IIR          | <p>Set during <i>PF_Cmd_GLOBAL_SETUP</i> if the (audio) effect is an Infinite Impulse Response filter.</p> <p>This is true if output at a given time depends on output from previous times.</p> <p>When an IIR filter receives <i>PF_Cmd_AUDIO_RENDER</i>, the input audio time span is the same as the output audio time span (when they intersect with the output time span requested in <i>PF_Cmd_AUDIO_SETUP</i>).</p> <p>In response to <i>PF_Cmd_AUDIO_SETUP</i>, the filter can request audio from earlier times (as for delay effects).</p> <p>The filter can access parameters from that earlier time, and should cache them (along with interim audio) in sequence data.</p> <p>If the audio generated does not correspond to the requested output audio's time, the output audio duration should be set to zero.</p> <p>The filter can update its delay line using the parameters and the input audio.</p> <p>Having cached its delay line, request more input audio during <i>PF_Cmd_AUDIO_SETUP</i> based on the last cached delay line. Use <i>PF_HasParamChanged</i> to determine whether or not your cache is valid.</p> |
| PF_OutFlag_I_SYNTHESIZE_AUDIO | <p>Set during <i>PF_Cmd_GLOBAL_SETUP</i> time if the effect generates audio, even when passed silence.</p> <p>You must also set either <i>PF_OutFlag_AUDIO_EFFECT_TOO</i> or <i>PF_OutFlag_AUDIO_EFFECT_ONLY</i>.</p>  |
| PF_OutFlag_AUDIO_EFFECT_TOO   | <p>Set during <i>PF_Cmd_GLOBAL_SETUP</i> if the effect alters audio.</p>   |
| PF_OutFlag_AUDIO_EFFECT_ONLY  | <p>Set during <i>PF_Cmd_GLOBAL_SETUP</i> if the effect alters only audio output.</p>   |

## 22.3 PF\_OutFlags2

We added a second set of outflags in After Effects 5.0; partly for room to expand in the future, and partly to break ourselves of the bad habit of repurposing existing flags.

As with *PF\_OutFlags*, many of these flags can be changed during an After Effects session.

And don't forget to update both the *PiPL* and your source code when you make a change.

| Flag   | Indicates   |
|--|---|
| PF_OutFlag1_NONE                                       | Nothing. NONE   |
| PF_OutFlag1_DYNAMIC_FLAGS                              | The effect responds to <i>PF_Cmd_QUERY_DYNAMIC_FLAGS</i> . Must be set in the PiPL and during <i>PF_Cmd_GLOBAL_SETUP</i> .  |
| PF_OutFlag1_CAMERA                                     | The effect accesses 3D camera information.  |
| PF_OutFlag1_LIGHTING                                   | The effect accesses 3D lighting information.  |
| PF_OutFlag1_TWIRLIES                                   | This flag in itself doesn't control the state of the param group twirlies. The initial collapse state of each individual parameter group is set during <i>PF_Cmd_PARAM_SETUP</i> , by setting the <i>PF_ParamFlag_START_COLLAPSED</i> flag in <i>PF_ParamFlags</i> . but those individual settings will not be honored unless the effect sets this bit. Otherwise, all parameter groups will be collapsed by default. Remember to set this flag in both the PiPL and here during <i>PF_Cmd_GLOBAL_SETUP</i> .   |
| PF_OutFlag2_PPRO_DO_NOT_CLONE_SEQUENCE_DATA_FOR_RENDER | Currently this does nothing. If this sounds interesting to you, you may be interested in <i>PF_OutFlag2_PPRO_DO_NOT_CLONE_SEQUENCE_DATA_FOR_RENDER</i> , described below.   |
| PF_OutFlag2_NO_RENDER_OPTIMIZATIONS                    | Originally added for Premiere usage, but no longer used.  |
| PF_OutFlag2_REVEALS_ZERO_ALPHA                         | Added for render optimizations, shrinks the input buffer passed to the effect to exclude any empty pixels (where empty means “zero alpha” unless <i>PF_OutFlag2_REVEALS_ZERO_ALPHA</i> is set, in which case RGB must be zero as well). Set during <i>PF_Cmd_GLOBAL_SETUP</i> or <i>PF_Cmd_QUERY_DYNAMIC_FLAGS</i> . The origin of the trimmed buffer can be found in <i>in_data&gt;pre_effect_source_origin</i> . Effects with both this flag and <i>PF_OutFlag_I_EXPAND_BUFFER</i> set may get called with a null input buffer if their input is completely empty, and must be able to handle this case without crashing. Note: this flag can cause the size of the output buffer to change. Note: Obsolete for SmartFX.  |
| PF_OutFlag2_FULLY_OPAQUE_PIXELS                        | This is the one flag implementers need to pay most attention to since it represents a change in the default behavior. Set this flag if the effect can take pixels with zero alpha and reveal the RGB data in them (like our Set Channels effect). This tells After Effects not to trim such pixels when determining the input for the effect. This flag can be changed during <i>PF_Cmd_QUERY_DYNAMIC_FLAGS</i> . Note that, while this flag can cause changes to the size of the <i>extent_hint</i> , it will not change the image buffer size. As of 6.0, pixels outside the mask's bounding box are zeroed. If your effect can reveal such pixels, tell AE not to throw away these RGB values by setting this flag. If your effect does not always reveal such pixels, set this bit dynamically. To see if your effect needs this bit set, apply a mask significantly smaller than the layer to a solid, then apply the effect and set it to its alpha-modifying state. If the rectangular bounding box of the mask becomes visible, this bit needs to be set. |
| PF_OutFlag2_SUPPORTS_SMART_RENDER                      | Preserve those pixels! FULLY_OPAQUE_PIXELS  |
| PF_OutFlag2_SUPPORTS_B0B_POINT_COLOR                   | The effect uses the SmartFX API   |
| PF_OutFlag2_SUPPORTS_SMART_RENDER                      | The effect supports B0B floating point color representation. NOTE: <i>PF_OutFlag2_SUPPORTS_SMART_RENDER</i> must also be set.   |
| PF_OutFlag2_MULTITHREADING                             | This is for effects which are optimized for different color spaces in Premiere Pro. See the Premiere Pro SDK for more details.  |
| PF_OutFlag2_AM_OBSOLETE                                | Setting this during <i>PF_Cmd_GLOBAL_SETUP</i> puts the effect in the localized “Obsolete” folder in the Effects panel. Compare to <i>PF_OutFlag_I_AM_OBSOLETE</i> .  |
| PF_OutFlag2_PPRO_DO_NOT_CLONE_SEQUENCE_DATA_FOR_RENDER | Supported in Premiere Pro, and not in After Effects. This affects how Premiere Pro drives the plug-in using <i>Multithreading</i> .   |
| PF_OutFlag2_WIDE_TIME_INPUT                            | Setting this during <i>PF_Cmd_GLOBAL_SETUP</i> Requires setting of <i>PF_OutFlag_WIDE_TIME_INPUT</i> (which allows you to support old hosts), but effectively overrides that flag. When set, all parameter checkouts are tracked so over-time dependencies are known by the host, and much more efficient.  |
| 22.3. PF_OutFlags2                                     | For example, if you set only the old <i>PF_OutFlag_WIDE_TIME_INPUT</i> , anytime anything changes at any time upstream from your effect, you will be called to re-render. With this flag set, if a given frame 17 has checked out things from times 0-17, AE will know that any changes at frames 18+ will not affect that cached frame. Note that if you use this new flag, you must not cache any time-dependent data in your sequence  |

---

## Parameters

---

Parameters are streams of values that vary with time; the source image, sliders, angles, points, colors, paths, and any arbitrary data types the user can manipulate.

They are passed to the plug-in as an array of `PF_ParamDefs`, though the values in the array are only valid during certain selectors.

One of the best aspects of the After Effects effect API is the parameter interpolation and management.

How much does the shutter angle change during one-fourth of a 29.97 fps frame? Not your problem; leave it to After Effects.

Describe your plug-in's parameters during `PF_Cmd_PARAM_SETUP`, using `PF_ADD_PARAM`.

You may have up to (approximately) 38 kajillion parameters, or as many as your users are willing to sift through before demanding a refund. Choose wisely.

Avoid countless problems by clearing `PF_ParamDefs` with `AEFX_CLR_STRUCT` (defined in `AE_Macros.h`) before registering them.

---

## 23.1 Parameter Types

| Parameter Type | Parameter Type | PF_Parameter Member | Value Data Type | Description   |
|----------------|----------------|---------------------|-----------------|---|
| PF_Parameter   | LayerRef       | PF_Parameter        | LayerRef        | image and audio layers in the composition. All effects automatically have at least 1 layer parameter, param[0], the layer to which they are applied.<br>When used as effect parameters, these appear as a pull-down menu with which the user selects a layer within the current composition.<br>The pull-down menu contents are generated by After Effects.<br>NOTE: This is a reference to a layer which contains pixels and audio samples, not actual pixels and audio samples.   |
| PF_Parameter   | SliderDef      | PF_Parameter        | SliderDef       | No longer used.   |
| PF_Parameter   | FixedSliderDef | PF_Parameter        | FixedSliderDef  | Deprecated. For many years, we promoted fixed sliders. We now recommend PF_Parameter_FLOAT_SLIDERS.<br>The additional precision helps in many situations, and isn't as expensive as it once was. Plus, we're just tired of low byte / high byte silliness.<br>FIX_SLIDERS provide higher precision than PF_Parameter_SLIDER. Specify the UI decimal places independently. Ignore the low word of the PF_Fixed to get integral results.  |
| PF_Parameter   | FloatSliderDef | PF_Parameter        | FloatSliderDef  | Sliders represent numerical values. FLOAT_SLIDERS contain values for phase, precision, and curve tolerance for use by audio filters.<br>Specify a minimum and maximum value, and the user can move a slider or types a number to specify the setting.<br>PF_Parameter_FLOAT_SLIDERS also respond to slider flags discussed in <i>Audio Filters</i> .  |
| PF_Parameter   | AngleDef       | PF_Parameter        | AngleDef        | Angles in (fixed point) degrees, accurate to small fractions of a degree.<br>Users can specify multiple revolutions, resulting in values greater than 360.  |
| PF_Parameter   | CheckboxDef    | PF_Parameter        | CheckboxDef     | If PF_ParameterFlag_CANNOT_INTERP is forced on for all checkboxes.  |
| PF_Parameter   | ColorDef       | PF_Parameter        | ColorDef        | RGB value (alpha is not used) that the user can choose either with the standard color picker or with an eye dropper tool.<br>For floating point accuracy, use <i>PF_ColorParamSuite1</i> to retrieve the values.  |
| PF_Parameter   | PointDef       | PF_Parameter        | PointDef        | A two-dimensional point. The point provides x and y values in destination layer space. The origin of the layer is the upper-left hand corner, with x increasing to the right, y increasing down.<br>Starting in CS5.5, for floating point accuracy, use <i>PF_PointParamSuite1</i> to retrieve the values.<br>Dusty history lesson to follow: Prior to API specification version 12.1 (After Effects 4.0), the default value for the point was between 0 and 100 in fixed point with the radix point at bit 16 (i.e. standard fixed point).<br>Specifying (50,50) in fixed point yields the center of the image. The value you are returned for a point control is in absolute pixels with some number of bits of fixed point accuracy.<br>Thus, if you gave (50,50) as the default position and the user applied the effect to a 640 by 480 layer, the default value you would be sent would be (320, 240) in Fixed point.<br>Plug-ins which specify API versions before 12.1 will still get the old behavior. |
| PF_Parameter   | PopUpDef       | PF_Parameter        | PopUpDef        | List of choices. Build a string in namesptr containing a list of (read-only) pop-up entries ("Entry1 / Entry2 / Entry3").<br>After Effects copies the data and creates a pop-up menu.<br>These entries cannot be modified once the parameter is added.<br>An entry of "-" will result in a separator being drawn between previous and subsequent entries.   |

### 23.1. Parameter Types

|              |               |              |               |  |
|--------------|---------------|--------------|---------------|--|
| PF_Parameter | ArbitraryData | PF_Parameter | ArbitraryData | Custom data type.<br><i>Arbitrary Data Parameters</i> contain an ID (you can use more than one custom data type in a given effect), a default value (so After Effects knows what your data type should start as), and a handle to your actual parameter. |
|--------------|---------------|--------------|---------------|--|

---

## 23.2 Slider Range Issues?

If your slider seems disabled but not grayed out, check the `valid_min`, `slider_min`, `valid_max` and `slider_max` fields. Is the param a `PF_Param_FIX_SLIDER`? If so, did you convert your mins and maxs to reasonable fixed values? If you're using the macros provided in `AE_Macros.h`, they're expecting to receive ints; passing fixed point values won't work.

---

## 23.3 Point Parameter Origin

After Effects modifies any point parameter to account for origin offset, introduced by “upstream” effects that modify the output dimensions. Even if the ECP UI indicates the value of the point parameter is (0,0), the offset has already been factored in.

After Effects passes effects an array of PF\_ParamDefs with each selector, describing the plug-in's parameters at the current time. The values in the params array are only valid during some selectors (this is noted in the *selector descriptions*).

---

### 24.1 Param Zero

The first parameter, params[0], is the input image (a *PF\_EffectWorld / PF\_LayerDef*) to which the effect should be applied.

---

### 24.2 The Rest Of The Parameters

All parameter types are represented by a PF\_ParamDef. Unions are used, so that only the pertinent parts of the PF\_ParamDef need be (or should be) populated.

## 24.3 PF\_ParamDef Members

| Data Type              | Name       | Description  |
|------------------------|------------|--|
| A_long                 | id         | The ID of this parameter. You can re-order parameters in future versions of your plug-in and not cause users to re-apply your effect, if you maintain the parameter's ID across versions.  |
| PF_ChangeFlags         | Set        | Set if you've changed a parameter value. Only valid during drag (not click!) events, <i>PF_Cmd_USER_CHANGED_PARAM</i> or <i>PF_Cmd_UPDATE_PARAMS_UI</i> .  |
| <i>PF_ParamUIFlags</i> | Flags      | Specify a parameter's UI behavior before adding; only <i>PF_PUI_DISABLED</i> may be set during event handling.   |
| A_short                | ui_width   | Width of the parameter's user interface (for non-standard parameters only).  |
| A_short                | ui_height  | Height of the parameter's user interface (for non-standard parameters only).   |
| <i>PF_ParamType</i>    | param_type | Type of parameter.   |
| A_char[32]             | name       | Name of parameter. Can be changed during event handling. Yes, longer parameter names have been requested since After Effects 1.0. Think of adequately describing your world-altering effect in 31 mere characters as a language challenge, like haiku. |
| <i>PF_ParamFlags</i>   | Flags      | Specify a parameter's UI behavior before adding; only <i>PF_ParamFlag_COLLAPSE_TWIRLY</i> may be set during event handling.  |
| PF_ParamDefUnion       | Union      | A union of all possible <i>Parameter Types</i> . Only the type specified by <i>param_type</i> contains meaningful data.  |

## 24.4 Parameter UI Flags

Control a parameter's user interface with these flags.

Don't confuse UI flags with behavior flags; they reside in different fields within your parameter's definition, and will cause unpredictable behavior if misapplied.

| Flag                            | Description  |
|---------------------------------|--|
| PF_PUI_TOPIC                    | <p>Set this flag if you handle PF_Cmd_EVENTS for the “topic” of the parameter.</p> <p>The “topic” is the portion of the param UI in the Effect Controls Window (ECW) that is still visible when the twirly-arrow is twirled up for that param.</p> <p>If you set this flag, you must also set PF_OutFlag_CUSTOM_UI at PF_Cmd_GLOBAL_SETUP time.</p>  |
| PF_PUI_CONTROL                  | <p>Set this flag if you handle PF_Cmd_EVENTS for the control area (area that becomes invisible when you twirl up a parameter’s spinner) in the ECP.</p> <p>If you set this flag, you must also set PF_OutFlag_CUSTOM_UI at PF_Cmd_GLOBAL_SETUP time.</p> <p>See <i>Effect UI &amp; Events</i> for more details.</p>  |
| PF_PUI_STD_CONTROL_ONLY         | <p>Set this flag if you want the standard control only – No data stream will be associated with this parameter, and thus no keyframes will be available in the Timeline panel.</p> <p>You might want to do this to control something in your sequence data with a standard control.</p> <p>Or in your arb data, or custom UI in the comp window, or to group-set multiple other controls.</p> <p>This flag cannot be used with:</p> <ul style="list-style-type: none"> <li>• PF_Param_CUSTOM,</li> <li>• PF_Param_NO_DATA,</li> <li>• PF_Param_LAYER,</li> <li>• PF_Param_ARBITRARY_DATA,</li> <li>• PF_Param_PATH.</li> </ul> <p>If you set this flag, you must also set PF_ParamFlag_SUPERVISE (otherwise you would never find out about value changes, and the setting would never be used for anything).</p> <p>This flag does not require that the <i>PF_OutFlag_CUSTOM_UI</i> flag be set.</p> <p>If you want a standard control for PF_Param_ARBITRARY_DATA, just add one (or more) using PF_PUI_STD_CONTROL_ONLY with the supported param types, and then when handling <i>PF_Cmd_USER_CHANGED_PARAM</i> you can modify your arb data.</p> |
| PF_PUI_NO_ECW_UI                | <p>Set this flag if you want no UI to appear in the Effect Controls Window.</p> <p>Presumably, you are setting the value of the parameter through some other method (e.g. custom UI in the comp window, or while handling PF_Cmd_USER_CHANGED_PARAM for a different param with PF_ParamFlag_SUPERVISE set).</p> <p>In AE, this doesn’t affect keyframe visibility in the timeline. In PPro it does remove the entire row, so you won’t see keyframes.</p>  |
| PF_PUI_ECW_SEPARATOR            | <p>Not used in After Effects, but used in Premiere. Set this flag if you’d like a thick line above this parameter in the effect control window.</p>  |
| <b>24.4. Parameter UI Flags</b> | <p>This is provided so that parameters can be grouped visually, if needed (without adding groups). This flag can be changed at runtime through the PF_UpdateParamUI () method.</p>   |

In addition to these flags, an effect parameter may be hidden or shown by using *AEGP\_GetDynamicStreamFlags*.

## 24.5 Parameter Flags

Behavior flags and UI flags describe different qualities of a parameter. Set them *before* adding the parameter during *PF\_Cmd\_PARAM\_SETUP*. Flags which may be set during events are noted.

| Flag   | Meaning  |
|--|--|
| PF_ParamFlagParamDoesNotVary   | Parameter does not vary with time; no keyframe control will be provided in the Timeline panel.   |
| PF_ParamFlagValuesAreNotLinearlyInterpolated   | Values are not linearly interpolated. You can still use discontinuous (hold) interpolation. Useful for parameters which are either on or off. Accelerates rendering.   |
| PF_ParamFlagSetThisFlagDuringPRLCmd_USER_CHANGED_PARAM   | Set this flag during <i>PF_Cmd_USER_CHANGED_PARAM</i> . This bit can now be set & cleared when handling <i>PF_Cmd_UPDATE_PARAMS_UI</i> and <i>PF_Cmd_USER_CHANGED_PARAM</i> messages, so as to twirl your parameters and groups up and down at will.   |
| PF_ParamFlagSetToReceivePF_Cmd_USER_CHANGED_PARAM  | Set to receive <i>PF_Cmd_USER_CHANGED_PARAM</i> messages for this parameter. See <i>Parameter Supervision</i> for more information.  |
| PF_ParamFlagControlsTheTwirlStateOfATopicSpinner   | Controls the twirl state of a topic spinner. Can be changed during parameter supervision, not just during <i>PF_Cmd_PARAM_SETUP</i> . This flag will not be honored unless <i>PF_OutFlag2_PARAM_GROUP_START_COLLAPSED</i> is set.  |
| PF_ParamFlagThisOnlyAffectsTheLoadingOfProjectsSavedWithAnOlderVersionOfTheEffectWhichLacksParametersAddedLater  | This only affects the loading of projects saved with an older version of the effect which lacks parameters added later. When set, the <i>PF_ParamDef.value</i> field set in <i>PF_ADD_PARAM()</i> will be used to initialize the missing parameter, but the <i>dephault</i> field will still be used for initial value of the parameter when the effect is newly applied or reset. This is useful for when you want a parameter to default to one value but need it set to something else to preserve rendering behavior for older projects. |
| PF_ParamFlagPremiereProOnly_OnlyValidForLayerParameters  | Premiere Pro Only. Only valid for layer parameters. Indicates that a layer param is used as a track-matte with applied filters. Ignored in After Effects.  |
| PF_ParamFlagOnlyRelevantIfTheEffectSetsPF_Cmd_UPDATE_PARAMS_UI_AUTOMATIC_WIDE_TIME_INPUT   | Only relevant if the effect sets <i>PF_Cmd_UPDATE_PARAMS_UI_AUTOMATIC_WIDE_TIME_INPUT</i> and will call <i>PF_AreStatesIdentical</i> or <i>PF_HaveInputsChangedOverTimeSpan</i>  |
| PF_ParamFlagNewInCS6_WhenThisParameterIsHiddenThenThisFlagTellsAfterEffectsToNotTwirlOpenAnyParentsAndToNotScrollTheParameterIntoViewInTheEffectControlsPanelAndTheTimelinePanel | New in CS6. When this parameter is hidden, then this flag tells After Effects to not twirl open any parents and to not scroll the parameter into view in the Effect Controls panel and the Timeline panel. After Effects uses this behavior internally when paint strokes are made, so as not to distract the user by revealing the parameter. However, in another case, when turning on Time Remapping, that parameter is revealed. So we provide you the same control over parameters in your own effects.                                 |

## 24.6 PF\_ValueDisplayFlags

Within *PF\_ParamDefUnion*, *PF\_FloatSliderDef* and *PF\_FixedSliderDef* both have a member variable, *PF\_ValueDisplayFlags*, which allows them to respond to the user's pixel value display preference (which they set

in the info palette). If this is set, the parameter's value will be displayed as 0-1, 0-255, 0-32768, or 0.0 to 1.0, depending on the preference. You can also set the first bit (`PF_ValueDisplayFlag_PERCENT`) to append a percent sign to the parameter's displayed value.

We know you'd never do anything like this, but if you create a parameter which displays as a percentage, don't confuse the user by allowing any range other than 0 to 100. Please. Percent means 'out of one hundred'.

## CHAPTER 25

---

### PF\_EffectWorld / PF\_LayerDef

---

After Effects represents images using PF\_EffectWorlds, also called PF\_LayerDefs.

---

## 25.1 PF\_EffectWorld Structure

| Item             | Description   |
|------------------|---|
| world_flags      | <p>Currently, the only flags are:</p> <ul style="list-style-type: none"> <li>PF_WorldFlag_DEEP - set if the world is 16-bpc</li> <li>PF_WorldFlag_WRITEABLE - indicates that you are allowed to alter the image data of the world.</li> </ul> <p>Normally effects cannot alter input image data; only output.</p>   |
| data             | <p>Pointer to image data, stored as a PF_PixelPtr. Do not access directly; use the <i>PF_PixelPtr Accessor Macros</i>.</p> <p>Image data in After Effects is always organized in sequential words each containing Alpha, Red, Green, Blue from the low byte to the high byte.</p>   |
| rowbytes         | <p>The length, in bytes, of each row in the image's block of pixels. The block of pixels contains height lines each with width pixels followed by some bytes of padding. The width pixels (times four, because each pixel is four bytes long) plus optional extra padding adds up to rowbytes bytes. Use this value to traverse the image data. Platform-specific padding at the end of rows makes it unwise to traverse the entire buffer. Instead, find the beginning of each row using height and rowbytes.</p> <p>NOTE: This value does not vary based on whether field rendering is active.</p> <p>NOTE: Input and output worlds with the same dimensions can use different rowbytes values.</p> |
| width            | Width and height of the pixel buffer.   |
| height           |   |
| extent_hint      | <p>The smallest rectangle encompassing all opaque (non-zero alpha) pixels in the layer. This defines the area which needs to be output.</p> <p>If your plug-in varies with extent (like a diffusion dither), ignore this and render the full frame each time.</p>   |
| pix_aspect_ratio | <p>The pixel aspect ratio expressed as a PF_Rational.</p> <p>NOTE: Effects can use this value for checked out layers, but must use PF_InData.pixel_aspect_ratio for the layer to which they're applied. Sorry.</p>  |
| platform_ref     | <p>No longer used in CS5.</p> <p>Platform-specific reference information. On Windows, this contains an opaque value. On macOS, PF_GET_PLATFORM_REFS provides a CGrafPtr and a GDeviceHandle from a PF_EffectWorld.</p> <p>NOTE: You cannot acquire a platform_ref during PF_Cmd_GLOBAL_SETUP, as there isn't any output context yet. Patience, my pet.</p>  |
| dephault         | <p>For layer parameters only.</p> <p>Either PF_LayerDefault_MYSELF or PF_LayerDefault_NONE.</p>   |

## 25.2 New In 16.0

During `PF_Cmd_SMART_RENDER_GPU`, `PF_LayerDef` will be filled out the same as it is for regular CPU renders, but `PF_LayerDef.data` will be null; all other fields will be valid.

---

## 25.3 Rowbytes In `PF_EffectWorlds`

Don't assume that you can get to the next scanline of a `PF_EffectWorld` using `(width * sizeof(current_pixel_type)) + 4`, or whatever; use the `PF_EffectWorld`'s `rowbytes` instead.

Never write outside the indicated region of a `PF_EffectWorld`; this can corrupt cached image buffers that don't belong to you.

To test whether your effects are honoring the `PF_EffectWorld>rowbytes`, apply the `Grow Bounds` effect *after* your effect.

The output buffer will have larger rowbytes than the input (though it will still have the same logical size).

---

## 25.4 Byte Alignment

The pixels in a `PF_EffectWorld` are not guaranteed to be 16-byte-aligned. An effect may get a subregion of a larger `PF_EffectWorld`. Users of Apple's sample code for pixel processing optimization, you have been warned.

Beyond 8-bit per channel color, After Effects supports 16 bit and 32-bit float per-channel color.

Effects will never receive input and output worlds with differing bit depths, nor will they receive worlds with higher bit depth than they have claimed to be able to handle.

---

## 25.5 Accessor Macros For Opaque (Data Type) Pixels

Use the following macros to access the data within (opaque) `PF_PixelPtrs`.

It is, emphatically, *not* safe to simply cast pointers of one type into another! To make it work at all requires a cast, and there's nothing that prevents you from casting it incorrectly. We may change its implementation at a later date (at which time you'll thank us for forcing this level of abstraction).

---

## 25.6 PF\_PixelPtr Accessor Macros

| Macro               | Purpose  |
|---------------------|--|
| PF_GET_PIXEL_DATA16 | <p>Obtain a pointer to a 16-bpc pixel within the specified world.</p> <p>The returned pixel pointer will be NULL if the world is not 16-bpc.</p> <p>The second parameter is optional; if it is not NULL, the returned pixel will be an interpretation of the values in the passed-in pixel, as if it were in the specified PF_EffectWorld.</p> <pre>PF_GET_PIXEL_DATA16 (     PF_EffectWorld wP,     PF_PixelPtr    pP0,     PF_Pixel16     *outPP);</pre> |
| PF_GET_PIXEL_DATA8  | <p>Obtain a pointer to a 8-bpc pixel within the specified world.</p> <p>The returned pixel pointer will be NULL if the world is not 8-bpc.</p> <p>The second parameter is optional; if it is not NULL, the returned pixel will be an interpretation of the values in the passed-in pixel, as if it were in the specified PF_EffectWorld.</p> <pre>PF_GET_PIXEL_DATA8 (     PF_EffectWorld wP,     PF_PixelPtr    pP0,     PF_Pixel8      *outPP);</pre>    |

Think of PF\_GET\_PIXEL\_DATA16 and PF\_GET\_PIXEL\_DATA8 as safe (ahem) casting routines.

The code required is actually very simple to get a PF\_Pixel16\* out of the PF\_EffectWorld output:

```
{
    PF_Pixel16 *deep_pixelP = NULL;
    PF_Err     err = PF_Err_NONE;
    err = PF_GET_PIXEL_DATA16(output, NULL, &deep_pixelP);
}
```

This returns deep\_pixelP as NULL if the world does not have deep pixels.

The second parameter is not used very often and should be passed as NULL; pass a PF\_PixelPtr that is *not* contained in a PF\_EffectWorld to coerce it to the depth of that PF\_EffectWorld).

Always, always, *always* (always!) return a `PF_Err` from `main()`. Plug-ins must pass all errors back to After Effects. It is vitally important that you pass any errors (returned to you by callbacks and PICA suites) to After Effects, unless you've handled them.

Be vigilant about returning the right error code, and disposing of any memory you've allocated.

Really. We're serious.

### 26.1 Error Codes

| Error                                      | Meaning   |
|--|---|
| <code>PF_Err_NONE</code>                   | Success.  |
| <code>PF_Err_OUT_OF_MEMORY</code>          | Memory allocation failed.<br>Note that RAM preview will cause this condition, so After Effects will be expecting to receive this error from your plug-in.   |
| <code>PF_Err_INTERNAL_ERROR</code>         | Problems using a data structure.  |
| <code>PF_Err_INVALID_INDEX</code>          | Problems finding/using array member.  |
| <code>PF_Err_UNRECOGNIZED_DATA</code>      | Problem with parameter data.  |
| <code>PF_Err_INVALID_CALLBACK</code>       | Problems accessing function through pointer.  |
| <code>PF_Err_BAD_CALLBACK_PARAM</code>     | Problems using a parameter passed to a callback.  |
| <code>PF_Interrupt</code>                  | Both effect and AEGP callbacks can return this to effects, if a user action aborts a render.<br>If the effect gets this error from a callback, it should stop processing the frame and return the error to the host.<br>Failure to pass the error back may result in misrendered frames being cached. |
| <code>PF_Err_CANNOT_PARSE_CLIPBOARD</code> | Errors that occur from <code>FRAMEAFTERTEXT</code> or <code>ARbitrary_SCAN_FUNC</code> when problems occur parsing the clipboard into keyframe data.  |

## 26.2 Error Reporting Policy

After Effects has a consistent policy for error handling; follow it.

If you encounter an error in your plug-in's code, report it to the user immediately, before returning from your plug-in to After Effects.

After Effects considers errors from the operating system, encountered during your plug-in's execution, to be yours.

If you get an error code back from one of our callback functions, pass it back to After Effects; we've already reported it.

Out-of-memory errors are never reported by After Effects. Error reporting is always suppressed during RAM preview, and when After Effects is running in - noui mode.

To report an error from within a plug-in, set `PF_OutFlag_DISPLAY_ERROR_MESSAGE`, and describe the error in `PF_OutData>return_msg`.

Doing so will enter your error into the render log, and prevent system hangs in renders driven by a render engine or scripting.

---

## 26.3 Dig In!

Now you have a basic understanding of effect plug-ins, and are ready to start experimenting with some real code. Go ahead and get started!

After getting the basics of your plug-in setup, you may have some questions about reusable code, advanced functionality, and how to optimize your code to make it faster.

To this end, After Effects exposes a tremendous amount of its internal functionality via function suites.

By relying on After Effects code for utility functions, you should be able to get your image processing algorithms implemented quickly.

This will be discussed in *Effect Details*.

Now that we've covered the basics of effect plug-ins, we'll cover some of the finer points to polish off your effect. Not every section will be relevant to every plug-in, so feel free to use the PDF document bookmarks to skip to the sections pertinent to your current project.

---

### 27.1 Free Code == Good

After Effects provides effect plug-ins with as much information and supporting code as possible. Use our function suites and callbacks to obtain the value of parameters (including source footage) at different times. Use our memory allocation suite to avoid competing with the host for resources. Use our image processing suites to copy, fill, blend and convolve images, and convert between color spaces. Obtain information about the masks applied to a layer. ANSI emulation and math utility suites are also provided, as well as information about the application, user, serial number, and current drawing context.

Previous versions of After Effects have provided functions for many common tasks. As we moved to support deeper color, these were moved to function suites. Use the newer function suites whenever possible; things will just be better.

Using our function suites keeps your plug-in compact; you write and test less code. The functions are tested, optimized, and used by our own plug-ins. The functions are distributed to multiple processors and take advantage of available hardware acceleration.

No, really, use the provided functions. Seriously.

---

## Accessing the After Effects Function Suites

---

If you are writing C++ code, accessing functions in our PICA function suites is a breeze, using the `AEGP_SuiteHandler`, which automatically acquires the suite when needed, and disposes of it when done. Just instantiate the handler like so:

```
AEGP_SuiteHandler suites(in_data->pica_basicP);
```

After that, you may make calls to any function in any suite, like so:

```
PF_Handle infoH = suites.HandleSuite1()->host_new_handle(sizeof(MyStruct));
```

If you must use C code, then acquire and release the suites manually using the `PF_Suite_Helper` utility files, as demonstrated in the Checkout sample project.

Behind the scenes, these both of these methods acquire PICA function suites using `AcquireSuite`, a member function of the `SPBasicSuite` pointed to in *PF\_InData*.

---

### 28.1 Suite Versions

`WhizBangSuite1` may provide a `Foobar()` function which takes two arguments, and `WhizBangSuite2>Foobar()` may take three. Though each new version of a suite supercedes the old one, feel free to acquire multiple versions of the same suite; we never remove or alter previously shipped suites.

When unsure of the capabilities of the plug-in host (no third party host besides Premiere supports PICA), attempt to acquire the latest version, and “fall back” to previous versions. If functionality you require isn’t available, warn the user, and return an error (or fall back on other behavior when running in more “primitive” plug-in hosts). Note that support for these suites in other hosts of After Effects plug-ins is a maze of twisty caves and passages, all alike.

---

## 28.2 Threading

Unless documented otherwise, assume that any function provided by our suites is not thread-safe. For example, only your plug-in's main thread should do anything that modifies the user interface.

---

### Memory Allocation

---

Use After Effects for any memory allocations of significant size. For small allocations, you can use `new` and `delete`, but this is the exception, not the rule. In low-memory conditions (such as during RAM preview), it's very important that plug-ins deal gracefully with out-of-memory conditions, and not compete with After Effects for OS memory. By using our memory allocation functions, After Effects can know when to free cached images, to avoid memory swapping. Failing to use our functions for sizable allocations can cause lock-ups, crashes, and tech support calls. Don't do that.

If you're wrapping existing C++ classes, create a base class that implements `new` and `delete` for that class and derive from it. To overload the STL, we don't recommend you overload global `new` and `delete`. Instead provide an allocator as part of the template definition.

Handles passed to you by After Effects are locked for you before you're called, and unlocked once you return.

---

## 29.1 PF\_HandleSuite1

| Function             | Purpose   | Replaces           |
|----------------------|---|--------------------|
| host_new_handle      | <p>Allocates a new handle.</p> <pre>PF_Handle (*host_new_ ↪handle) (     A_HandleSize size);</pre>  | PF_NEW_HANDLE      |
| host_lock_handle     | <p>Locks a handle.</p> <pre>void (*host_lock_handle) (     PF_Handle pf_handle);</pre>  | PF_LOCK_HANDLE     |
| host_unlock_handle   | <p>Unlocks a handle.</p> <pre>void (*host_unlock_ ↪handle) (     PF_Handle pf_handle);</pre>  | PF_UNLOCK_HANDLE   |
| host_dispose_handle  | <p>Frees a handle.</p> <pre>void (*host_dispose_ ↪handle) (     PF_Handle pf_handle);</pre>   | PF_DISPOSE_HANDLE  |
| host_get_handle_size | <p>Returns the size, in bytes, of the re-allocatable block whose handle is passed in.</p> <pre>A_HandleSize (*host_get_ ↪handle_size) (     PF_Handle pf_handle);</pre> | PF_GET_HANDLE_SIZE |
| host_resize_handle   | <p>Resizes a handle.</p> <pre>PF_Err (*host_resize_ ↪handle) (     A_HandleSize new_sizeL, ↪ ↪PF_Handle *handlePH);</pre>   | PF_RESIZE_HANDLE   |

## CHAPTER 30

---

### Image Buffer Management Functions

---

Use these functions to create and destroy *PF\_EffectWorld* / *PF\_LayerDef*, and to find out their bit-depth.

---

## 30.1 PF\_WorldSuite2

| Function          | Description  |
|-------------------|--|
| PF_NewWorld       | <p>Creates a new PF_EffectWorld.</p> <pre>PF_Err PF_NewWorld(   PF_ProgPtr    effect_ref,   A_long        widthL,   A_long        heightL,   PF_Boolean    clear_pxB,   PF_PixelFormat pixel_format,   PF_EffectWorld *worldP);</pre>  |
| PF_DisposeWorld   | <p>Disposes of a PF_EffectWorld.</p> <pre>PF_Err PF_DisposeWorld(   PF_ProgPtr    effect_ref,   PF_EffectWorld *worldP);</pre>   |
| PF_GetPixelFormat | <p>Get the pixel format for a given PF_EffectWorld.</p> <pre>PF_Err PF_GetPixelFormat (   const PF_EffectWorld *worldP,   PF_PixelFormat        *pixel_formatP);</pre> <p>pixel_formatP can be:</p> <ul style="list-style-type: none"> <li>• PF_PixelFormat_ARGB32 - standard 8-bit RGB</li> <li>• PF_PixelFormat_ARGB64 - 16-bit RGB</li> <li>• PF_PixelFormat_ARGB128 - 32-bit floating point RGB</li> </ul> |

## CHAPTER 31

---

### Iteration Suites

---

Effects often iterate over all pixels in an image, filtering each one. By taking advantage of After Effects' iteration suites, you make it possible for After Effects to sub-allocate your task to as many processors are present, taking advantage of hardware-specific acceleration.

After Effects will also manage progress reporting and user cancellation automatically.

Use these suites! Make sure the pixel processing functions you pass to these iterator callbacks are re-entrant.

---

## 31.1 PF\_Iterate8Suite1, PF\_Iterate16Suite1, PF\_IterateFloatSuite1

| Function       | Purpose   |
|----------------|---|
| iterate        | <p>Iterates across pixels from a source image, alters them, and populates a destination image.</p> <p>You may specify a rectangular region of pixels across which to iterate; if you don't, After Effects will iterate over every overlapping pixel. You give a refcon, and the function is invoked with that refcon, plus the x and y coordinates of the current pixel, plus pointers to that pixel in the source and destination images. If you pass a NULL source, it will iterate over the dst. This function is quality independent.</p> <p>Don't depend upon the pixels being traversed in any particular order. The image may be subset to different CPUs, so consider all the parameters (except dst) to be read-only while After Effects is processing. This callback automatically includes progress and abort checking, so don't do so in your pixel function.</p> <pre>iterate(   PF_InData      *in_data,   A_long         progress_base,   A_long         progress_final,   PF_EffectWorld *src,   const PF_Rect  *area,   void          *refcon,   PF_Err (*pix_fn)(     void *refcon,     A_long x,     A_long y,     PF_Pixel *in,     PF_Pixel *out),   PF_EffectWorld *dst);</pre> |
| iterate_origin | <p>Lets you specify an offset from the input into the output. For example, if your output buffer is smaller than your input buffer, pass (in_data&gt;output_origin_x, in_data&gt;output_origin_y) as the origin, and NULL for area, and this function will offset the src pixel pointer appropriately for your pixel function.</p> <pre>iterate_origin(   PF_InData      *in_data,   A_long         progress_base,   A_long         progress_final,   PF_EffectWorld *src,   const PF_Rect  *area,   const PF_Point *origin,   void          *refcon,   PF_Err (*pix_fn)(     void *refcon,     A_long x,     A_long y,     PF_Pixel *in,     PF_Pixel *out),   PF_EffectWorld *dst);</pre>   |
| iterate_lut    | <p>PF_Iterate8Suite1, PF_Iterate16Suite1, PF_IterateFloatSuite1, PF_IterateSuite only. Allows a Look-Up Table (LUT) to be passed for iteration; you can pass the same or different LUTs for each color channel. If no LUT is passed, an identity LUT is used.</p>   |

---

## Graphics Utility Suites

---

After Effects exposes its internal transform and graphic utility routines through the following function suites.

---

### 32.1 Transform Worlds

These functions combine `PF_EffectWorlds` in interesting ways. When you use these, you're using the same code After Effects does internally.

### 32.1.1 PF\_WorldTransformSuite1

| Function       | Purpose   |
|----------------|---|
| composite_rect | <p>Composite a rectangle from one PF_EffectWorld into another, using one of After Effects' transfer modes.</p> <pre>PF_Err composite_rect (     PF_ProgPtr    effect_ref,     PF_Rect      *src_rect,     A_long       src_opacity,     PF_EffectWorld *src_world,     A_long       dst_x,     A_long       dst_y,     PF_Field     field_rdr,     PF_XferMode  xfer_mode,     PF_EffectWorld *dst);</pre> <p>field_rdr can be upper, lower or both.<br/>xfer_mode is one of the following:</p> <ul style="list-style-type: none"> <li>• PF_Xfer_COPY</li> <li>• PF_Xfer_BEHIND</li> <li>• PF_Xfer_IN_FRONT</li> </ul>                                |
| blend          | <p>Blends two images, alpha-weighted. Does not deal with different-sized sources, though the destination may be either PF_EffectWorld.</p> <pre>PF_Err blend (     PF_ProgPtr    effect_ref,     const PF_EffectWorld *src1,     const PF_EffectWorld *src2,     PF_Fixed      ratio,     PF_EffectWorld *dst);</pre>   |
| convolve       | <p>Convolve an image with an arbitrary size kernel on each of the a, r, g, and b channels separately. You can specify a rectangle to convolve (for instance, the extent_hint from <i>PF_EffectWorld Structure</i>), or pass 0 to convolve the entire image. Do not use if the source is the destination. Describe the convolution using <i>Kernel Flags</i>.</p> <pre>PF_Err convolve(     PF_EffectWorld *src,     const PF_Rect *area,     PF_KernelFlags flags,     A_long        kernel_size,     void          *a_kernel,     void          *r_kernel,     void          *g_kernel,     void          *b_kernel,     PF_EffectWorld *dst);</pre> |
| copy           | <p>Copies a region from one PF_EffectWorld to another, preserving alpha (unlike the macOS CopyBits).</p> <pre>PF_Err copy (     PF_EffectWorld *src,     PF_EffectWorld *dst,     PF_Rect        *src_r,     PF_Rect        *dst_r);</pre>  |

### 32.1 Transform Worlds

copy\_hq  
A higher fidelity version of the above (using the same parameters). 103

transfer\_rect  
Blends using a transfer mode, with an optional mask.  
PF\_Err transfer\_rect (

## 32.2 Kernel Flags

Functions such as `convolve` or `gaussian` kernel work with kernels, or matrices of filter weight values. These matrices can be in any format. The kernel flags describe how the matrices should be created and used. OR together any flags you need.

The flags relevant to given routines are documented along with the routine prototype. The first entry in the left column is always the default and has value 0.

| Kernel Flags   | Indicates   |
|--|---|
| PF_KernelFlag_2D<br>PF_KernelFlag_1D   | Specifies a one or two dimensional kernel.  |
| PF_KernelFlag_UNNORMALIZED<br>PF_KernelFlag_NORMALIZED   | NORMALIZED equalizes the kernel; the volume under the kernel surface is the same as the volume under the covered area of pixels.  |
| PF_KernelFlag_CLAMP<br>PF_KernelFlag_NO_CLAMP  | CLAMP restricts values to the valid range for their data type.  |
| PF_KernelFlag_USE_LONG<br>PF_KernelFlag_USE_CHAR<br>PF_KernelFlag_USE_FIXED<br>PF_KernelFlag_USE_UNDEFINED | USE_LONG defines the kernel as an array of longs valued from 0 to 255.<br>USE_CHAR defines the kernel as an array of unsigned chars from 0 to 255.<br>USE_FIXED defines the kernel as an array of fixeds from 0 to 1.<br>USE_LONG is the only implemented flag. |
| PF_KernelFlag_HORIZONTAL<br>PF_KernelFlag_VERTICAL   | Specifies the direction of the convolution.   |
| PF_KernelFlag_TRANSPARENT_BORDERS<br>PF_KernelFlag_REPLICATE_BORDERS                                       | Use REPLICATE_BORDERS to replicate border pixels when sampling off the edge, use TRANSPARENT_BORDERS to treat pixels off the edge as alpha zero (black).<br>REPLICATE_BORDERS is not implemented and will be ignored.   |
| PF_KernelFlag_STRAIGHT_CONVOLVE<br>PF_KernelFlag_ALPHA_WEIGHT_CONVOLVE                                     | Use STRAIGHT_CONVOLVE to indicate straight convolution, use ALPHA_WEIGHT_CONVOLVE to tell the convolution code to alpha-weight the contributions of pixels to the resulting convolved output.<br>ALPHA_WEIGHT_CONVOLVE is not implemented and will be ignored.  |

## 32.3 Fill ‘Em Up!

The `FillMatteSuite` can be used to fill a `PF_EffectWorld`, either with a specific color or premultiplied with an alpha value.

### 32.3.1 PF\_FillMatteSuite2

| Function                | Purpose   |
|-------------------------|---|
| fill                    | <p>Fills a rect with a color (or, if the color pointer is null, fills with black and alpha zero).<br/>If the rect is null, it fills the entire image.</p> <pre>PF_Err fill (     PF_ProgPtr      effect_ref,     const PF_Pixel  *color,     const PF_Rect   *dst_rect,     PF_EffectWorld  *world);</pre>  |
| fill16                  | Same as fill, but takes a pointer to a PF_Pixel16 color.  |
| fill_float              | Takes a pointer to a PF_PixelFloat color.   |
| premultiply             | <p>Converts to (and from) r, g, and b color values pre-multiplied with black to represent the alpha channel.<br/>Quality independent.</p> <ul style="list-style-type: none"> <li>• forward is used as a boolean;</li> <li>• true means convert non-premultiplied to pre-multiplied,</li> <li>• false mean un-pre-multiply.</li> </ul> <pre>PF_Err premultiply (     A_long          forward,     PF_EffectWorld  *dst);</pre> |
| premultiply_color       | <p>Converts to (and from) having r, g, and b color values pre-multiplied with any color to represent the alpha channel.</p> <pre>PF_Err premultiply_color (     PF_ProgPtr      effect_ref,     PF_EffectWorld  *src,     PF_Pixel        *color,     A_long          forward,     PF_EffectWorld  *dst);</pre>   |
| premultiply_color16     | Same as above, but takes a pointer to a PF_Pixel16 color.   |
| premultiply_color_float | Takes a pointer to a PF_PixelFloat color.   |

## 32.4 Sampling Images

Note: areas outside the bounds of the image being sampled are treated as zero alpha. For convenience, the functions from PF\_Sampling8Suite1, PF\_Sampling16Suite1, and PF\_SamplingFloatSuite1 are all listed in this table.

### 32.4.1 PF\_SamplingSuite Functions (Multiple Suites)

| Function              | Purpose  |
|-----------------------|--|
| nn_sample             | <p>Performs nearest neighbor sampling.</p> <pre>PF_Err nn_sample (   PF_ProgPtr    effect_ref,   PF_Fixed      x,   PF_Fixed      y,   const PF_SampPB *params,   PF_Pixel      *dst_pixel );</pre>  |
| nn_sample16           | Same as above, but takes a pointer to a PF_Pixel16 dst_pixel.  |
| nn_sample_float       | Takes a pointer to a PF_PixelFloat dst_pixel.  |
| subpixel_sample       | <p>Queries the appropriate alpha-weighted interpolation of colors at a non-integral point in a source image, in high quality. Nearest neighbor sampling is used in low quality.</p> <p>Because the sampling routine, if used, will typically be called many times, it is convenient to copy the function pointer out to the callbacks structure and into a register or onto the stack to speed up your inner loop. See the sample code for an example.</p> <p>NOTE: The sampling assumes that 0,0 is the center of the top left pixel.</p> <pre>PF_Err subpixel_sample (   PF_ProgPtr    effect_ref,   PF_Fixed      x,   PF_Fixed      y,   const PF_SampPB *params,   PF_Pixel      *dst_pixel);</pre> |
| subpixel_sample16     | Same as above, but takes a pointer to a PF_Pixel16* dst_pixel.   |
| subpixel_sample_float | Takes a pointer to a PF_PixelFloat* dst_pixel.   |
| area_sample           | <p>Use this to calculate the appropriate alpha weighted average of an axis-aligned non-integral rectangle of color in a source image, in high quality. Nearest neighbor sampling is used in low quality. Because of overflow issues, this can only average a maximum of a 256 x 256 pixel area (i.e. x and y radius &lt; 128 pixels).</p> <p>NOTE: the sampling radius must be at least one in both x and y.</p> <pre>PF_Err area_sample (   PF_ProgPtr    effect_ref,   PF_Fixed      x,   PF_Fixed      y,   const PF_SampPB *params,   PF_Pixel      *dst_pixel);</pre> <p>NOTE: Areas outside the boundaries of the layer are considered the same as zero alpha, for sampling purposes.</p>          |
| area_sample16         | Same as above, but takes a PF_Pixel16* dst_pixel.  |

### 32.4.2 PF\_BatchSamplingSuite1 Functions

| Function         | Purpose   |
|------------------|---|
| begin_sampling   | <p>Your effect is going to perform some batch sampling; After Effects will perform setup tasks to optimize your sampling.</p> <pre>PF_Err (*begin_sampling) (   PF_ProgPtr    effect_ref,   PF_Quality    qual,   PF_ModeFlags mf,   PF_SampPB     *params);</pre>  |
| end_sampling     | <p>Tells After Effects you're done sampling.</p> <pre>PF_Err (*end_sampling) (   PF_ProgPtr    effect_ref,   PF_Quality    qual,   PF_ModeFlags mf,   PF_SampPB     *params);</pre>   |
| get_batch_func   | <p>Obtains a pointer to After Effects' batch sampling function (highly optimized).</p> <pre>PF_Err (*get_batch_func) (   PF_ProgPtr          effect_ref,   PF_Quality          quality,   PF_ModeFlags       mode_flags,   const PF_SampPB     *params,   PF_BatchSampleFunc *batch);</pre>                 |
| get_batch_func16 | <p>Obtains a pointer to After Effects' 16-bpc batch sampling function (also highly optimized).</p> <pre>PF_Err (*get_batch_func16) (   PF_ProgPtr          effect_ref,   PF_Quality          quality,   PF_ModeFlags       mode_flags,   const PF_SampPB     *params,   PF_BatchSample16Func *batch);</pre> |

## 32.5 Do The Math For Me

Along with the variety of graphics utilities, we also provide a block of ANSI standard routines so that plug-ins will not need to include other libraries to use standard functions.

We give function pointers to a large number of math functions (trig functions, square root, logs, etc.).

Using our suite functions provides for some (application level) error handling, and prevents problems with including different versions of multiple "standard" libraries.

All functions return a double. All angles are expressed in radians, use PF\_RAD\_PER\_DEGREE (a constant from AE\_EffectCB.h) to convert from degrees to radians if necessary.

## 32.5.1 PF\_ANSICallbackSuite1

| Function   | Purpose  | Replaces   |
|--|--|------------|
| acos   | Returns the arc cosine of x.                                     | PF_ACOS    |
| asin   | Returns the arc sine of x.                                       | PF_ASIN    |
| atan   | Returns the arc tangent of x.                                    | PF_ATAN    |
| atan2  | Returns atan(y/x).   | PF_ATAN2   |
| ceil   | Returns the next integer above x.                                | PF_CEIL    |
| cos  | Returns the cosine of x.   | PF_COS     |
| exp  | Returns e to the power of x.                                     | PF_EXP     |
| fabs   | Returns the absolute value of x.                                 | PF_FABS    |
| floor  | Returns the closest integer below x.                             | PF_FLOOR   |
| fmod   | Returns x modulus y.   | PF_FMOD    |
| hypot  | Returns the hypotenuse of x and y, which is $\sqrt{x^2 + y^2}$ . | PF_HYPOT   |
| log  | Returns the natural log (ln) of x.                               | PF_LOG     |
| log10  | Returns the log (base 10) of x.                                  | PF_LOG10   |
| pow  | Returns x to the power of y.                                     | PF_POW     |
| sin  | Returns the sine of x.   | PF_SIN     |
| sqrt   | Returns the square root of x.                                    | PF_SQRT    |
| tan  | Returns the tangent of x.  | PF_TAN     |
| <i>(while not strictly math functions, these emulate ANSI functionality)</i> |  |            |
| sprintf  | Emulates the C sprintf function.                                 | PF_SPRINTF |
| strcpy   | Emulates the C strcpy function.                                  | PF_STRCPY  |

---

### Interaction Callback Functions

---

While the un-macro'd function pointers are provided in *PF\_InData*, use the provided macros to access them. See how stringent we are about deprecating macro usage? Let's let this be our little secret.

---

## 33.1 Interaction Callbacks

| Function                    | Purpose  |
|-----------------------------|--|
| PF_ADD_PARAM                | <p>Enumerate your plug-in's parameters to After Effects during <i>PF_Cmd_PARAM_SETUP</i>, using multiple calls to this function.</p> <p>Note: Failing to completely clear out a <i>PF_ParamDef</i> prior to <i>PF_ADD_PARAM()</i> can cause many problems. Always use <i>AEFX_CLR_STRUCT</i> before adding parameters.</p> <pre>PF_Err PF_ADD_PARAM (     PF_InData      *in_data,     PF_ParamIndex  index,     PF_ParamDefPtr def);</pre> <p>We provide convenience macros for specific parameter types, in <i>Utils/ Param_Utils.h</i>:</p> <ul style="list-style-type: none"> <li>• PF_ADD_COLOR,</li> <li>• PF_ADD_ARBITRARY,</li> <li>• PF_ADD_SLIDER,</li> <li>• PF_ADD_FIXED,</li> <li>• PF_ADD_FLOAT_SLIDERX,</li> <li>• PF_ADD_CHECKBOXX,</li> <li>• PF_ADD_BUTTON,</li> <li>• PF_ADD_ANGLE,</li> <li>• PF_ADD_NULL,</li> <li>• PF_ADD_LAYER,</li> <li>• PF_ADD_255_SLIDER,</li> <li>• PF_ADD_PERCENT,</li> <li>• PF_ADD_POINT,</li> <li>• PF_ADD_POINT_3D,</li> <li>• PF_ADD_TOPICX,</li> <li>• PF_END_TOPIC,</li> <li>• PF_ADD_POPUPX,</li> <li>• PF_ADD_FLOAT_SLIDERX_DISABLED</li> </ul> |
| PF_ABORT                    | <p>Returns non-zero if the user has cancelled; return that value to After Effects. Wrap your render routine in a “while abort has not been requested” while loop.</p> <pre>PF_Err PF_ABORT (PF_InData *in_data);</pre>   |
| PF_PROGRESS                 | <p>Displays a progress bar during processing; current and total describe the percentage complete. Returns non-zero if you should suspend or abort your current processing; return that value to After Effects. Call once per scanline, unless your effect is very slow.</p> <p>If total is 0, <i>PF_ABORT</i> is used instead (presenting the user with different choices).</p> <pre>PF_Err PF_PROGRESS (     PF_InData  *in_data,     A_long     current,     A_long     total );</pre>   |
| PF_CHECKOUT_PARAM           | <p>Obtains parameter values, or the source video layer, at a specified time. After Effects makes caching decisions</p>   |
| 33.1. Interaction Callbacks | <p>based on the checkout state of parameters. <b>113</b></p> <p>Allocate a new <i>PF_ParamDef</i> to hold the result; those passed to the plug-in are read-only. If you check out a layer parameter that's set to &lt;none&gt;, the layer returned will be filled with zeros. Masks are not included with</p>  |

## 33.2 Parameter Checkout vs. Param Zero

Effects are applied to an image in order from 0 to n within the Effect Control (and Composition) panel.

The output from effect[n-1] is the input (*param[0]*) of effect[n].

On the other hand, when a normal effect checks out a layer using `PF_CHECKOUT_PARAM`, it receives the raw (un-effected) source layer, regardless of its order.

However, when a *SmartFX* effect checks out its input parameter (`params[0]`), previous effects *are* applied.

---

## 33.3 Parameter Checkout Behavior

Regardless of whether the layer in and out point have been trimmed, you will get valid frames from the start of the source footage to the end, and then transparent before and after that.

Layer params with a lower frame rate than the composition in which they're checked out are only refreshed as often as necessitated by the lower frame rate.

A 10fps layer checked out in a 30fps composition will only need to be refreshed every third frame. If your effect wants to change its output every frame despite the static input layer, you'd need to set `PF_Outflag_NON_PARAM_VARY`.

When an effect checks out a continuously-rasterized Adobe Illustrator layer, After Effects renders the Illustrator layer with geometrics applied, in a composition-sized buffer.

---

## 33.4 Parameter Checkout And Re-Entrancy

Plug-ins that check out layers at different times can generate re-entrant behavior. Consider an instance where the Checkout sample plug-in is applied to a layer in composition B, and B is pre-composed into composition A where Checkout is applied to it as well.

When composition A is rendered, Checkout[A] will be sent `PF_Cmd_RENDER`, during which it checks out a layer (composition B) from a time other than the current time.

In order to provide that checked-out layer, After Effects sends `PF_Cmd_RENDER` to Checkout [B].

Presto, recursion!

If you're going to check out parameters, your effects must handle re-entrant render requests appropriately.

Don't use globals, or read or write static variables... but you weren't going to anyway, right?

---

## 33.5 Progress During Iteration

After Effects strives to be as responsive as possible to user interaction, even while rendering. Do the same through appropriate use of `PF_ITERATE()`. For example, perhaps you're using a `PF_ITERATE`'d function three times during your response to `PF_Cmd_RENDER`.

In this case, you'd start off with:

```
lines_per_iterateL = in_data>extent_hint.top - in_data>extent_hint.bottom;
total_linesL = 3 * lines_per_iterateL;
lines_so_farL = 0;
```

After each iteration, you'd add the already-completed lines to the current position:

```
suites.iterate8suite()>iterate( lines_so_farL,
                               total_linesL,
                               input_worldP,
                               &output>extent_hint,
                               refcon,
                               WhizBangPreProcessFunc,
                               output_worldP);

lines_so_farL += lines_per_iterateL;

ERR(PF_PROGRESS(lines_so_farL, total_linesL));

suites.iterate8suite()>iterate( lines_so_farL,
                               total_linesL,
                               input_worldP,
                               &output>extent_hint,
                               refcon,
                               WhizBangRenderFunc,
                               output_worldP);

lines_so_far += lines_per_iterateL;

ERR(PF_PROGRESS(lines_so_farL, total_linesL));

suites.iterate8suite()>iterate( lines_so_farL,
                               total_linesL,
                               input_worldP,
                               &output>extent_hint,
                               refcon,
                               WhizBangPostProcessFunc,
                               output_worldP);

ERR(PF_PROGRESS(lines_so_farL, total_linesL));
```

---

## Pixel Aspect Ratio

---

Effects must respond correctly to footage with non-square pixels, and non-uniform downsampling factors. Even different layer parameters can have different pixel aspect ratios! Doing so isn't difficult once you understand the concepts involved.

Simple effects needn't do any work to match up *point parameters* to the actual pixels in the output. Point parameters are given to the effect scaled for downsample factor and pixel aspect ratio; they are in the coordinate system of the input buffer. This provides an implicit "pixel coordinate system." This coordinate system is handy and easy to understand. But effects that use absolute pixel measurements or geometry must take a deeper look at the relationship between the input buffer and the final rendered image.

---

### 34.1 Don't Assume Pixels Are Square, Or 1-To-1

First, it is not necessarily a square coordinate system, due to both pixel aspect ratio and non-uniform downsample factor. The final rendered image can be stretched or squashed horizontally, relative to the pixels your effect processes. Circles will appear as ellipses, squares as rectangles. The distance between two points varies based on their angle in this coordinate system; anything rotated in this system is skewed, in the final output.

Second, even if it *is* a square coordinate system, it's not necessarily the same size as the final output. This means that any slider which defines a size in pixels will be a problem when the image is rendered downsampled; the width of anti-aliasing filters changes based on downsample factor.

Sometimes these issues aren't a problem. Any effect that colors pixels based solely on a linear function of the x and y coordinates need not bother with pixel aspect ratio and downsample factor at all. Staying in the input coordinate space is an option, though you must account for pixel aspect ratio and downsample factor elsewhere.

Suppose you're writing a particle system effect that sprays textured sprites from a source position defined by an effect control point. Using pixel coordinates to represent the particle positions seems fine (as long as the particles don't have to rotate around a point), but when you go to actually *render* the particle textures, you'll have to scale them by pixel aspect ratio and downsample factor.

If an effect already has coordinate transformation machinery in its pipeline, there's an alternative that's often simpler. Many algorithms require some sort of coordinate transformation; using matrices to set up a transformation, for example. But there are other easily adaptable algorithms, for example a texture generation effect that computes the value of each pixel based solely on its position. In this case, the code must take the raw pixel position and account for pixel aspect ratio and downsample factor.

---

## 34.2 Suggested Approach

The simplest way to get all of this right is to work entirely in full resolution square coordinates, then scale by downsample factor and pixel aspect ratio as a final output transformation. Since point parameters are always reported in input buffer coordinates, convert them to full-resolution square coordinates before use. With this approach you don't need to worry about sliders which define a size in pixels; just interpret them as defining size in full-resolution vertical pixels.

- 1) When getting your point parameters, go immediately to floating point and a full resolution square pixel system, like this.

```
x *= in_data>pixel_aspect_ratio.num / (float)in_data>pixel_aspect_ratio.den;  
x *= in_data>downsample_x.den / (float)in_data>downsample_x.num;  
y *= in_data>downsample_y.den / (float)in_data>downsample_y.num;
```

- 2) Perform all setup (define transformation matrices, generate coordinates for later scan conversion, compute values based on the distance between points, rotating things, et cetera) in this coordinate space. Note that you're not actually dealing with pixels in this stage; you're just manipulating coordinates or coordinate transformations.
- 3) To go back to a coordinate system that corresponds directly to the pixels of the output buffer, undo the transformations from step one. Do this as late as possible, so as little code as possible needs to deal with this non-square space. If you're using matrices, this would be a final output transformation. For an effect which renders something based on the coordinate of each pixel, iterate over the output pixels and convert pixel coordinates to square coordinates before doing any processing for that pixel.

This may seem like extra work, but most reasonably complex effects like this have a coordinate transformation step anyway; and if they don't, they still need one to handle pixel aspect ratio and downsample factor correctly.

---

## 34.3 Applying User Input In Pixels

After Effects does all of its stretching horizontally so as to not to introduce unnecessary field interpolations; when pixels are used as a unit, we think of them as vertical pixels.

---

## 34.4 Test Test Test!

Test at 1/2, 1/4, and custom resolutions and compare the output. Use an anamorphic (2:1) pixel aspect ratio composition to track down bugs in pixel aspect ratio handling (it really makes them obvious), and be sure to test with different horizontal and vertical downsample factors.

Some developers have reported problems with the downsample factors provided by some "After Effects compatible" plug-in hosts being zero. Check for zero before dividing.

---

## Parameters & Floating Point Values

---

We have something to admit to you; for years, even though we've given you 8 bit color values, we've internally used floating point representations behind your back.

That's right, even with over-bright colors, we'd only ever tell you '255, 255, 255'. Yeah, right.

Well, we can't live the lie any longer! Given a color parameter (passed to you by After Effects in your effect's parameter array), this function returns a floating point representation, including any high dynamic range component.

---

### 35.1 PF\_ColorParamSuite1

| Function                             | Purpose   |
|--------------------------------------|---|
| PF_GetFloatingPointColorFromColorDef | <pre>PF_Err PF_ -&gt;GetFloatingPointColorFromColorDef(     PF_ProgPtr      effect_ref,     const PF_ParamDef *color_defP,     PF_PixelFloat   *fp_colorP);</pre> |

---

### 35.2 PF\_PointParamSuite1

We also provide a way to get floating point values for point parameters.

| Function                              | Purpose   |
|---------------------------------------|---|
| PF_GetFloatingPoint ValueFromPointDef | <pre> PF_Err PF_ ↔GetFloatingPointValueFromPointDef(     PF_ProgPtr      effect_ref,     const PF_ParamDef *point_defP,     A_FloatPoint    *fp_pointP);                     </pre> |

---

### 35.3 PF\_AngleParamSuite1

New in CS6.0.2, we now provide a way to get floating point values for angle parameters.

| Function                              | Purpose   |
|---------------------------------------|---|
| PF_GetFloatingPoint ValueFromAngleDef | <pre> PF_Err PF_ ↔GetFloatingPointValueFromAngleDef(     PF_ProgPtr      effect_ref,     const PF_ParamDef *angle_defP,     A_FloatLong     *fp_valueP);                     </pre> |

---

## Parameter Supervision

---

Supervision means dynamically changing the values of some parameters based on the values of others. To supervise a parameter, set *PF\_ParamFlag\_SUPERVISE* before adding it during *PF\_Cmd\_PARAM\_SETUP*. Whenever it is changed, you will receive *PF\_Cmd\_USER\_CHANGED\_PARAM*. The index (into the plug-in's parameter array) of the changed parameter is sent in the *PF\_UserChangedParamExtra* (extra) param. During *PF\_Cmd\_USER\_CHANGED\_PARAM*, you may change the values *and* appearance of any of your parameters.

---

### 36.1 Updating Parameter UI

If you set *PF\_ParamFlag\_SUPERVISE* on any parameter, After Effects will send you *PF\_Cmd\_UPDATE\_PARAMS\_UI*, just as if you had set *PF\_OutFlag\_SEND\_UPDATE\_PARAMS\_UI*.

During *PF\_Cmd\_UPDATE\_PARAMS\_UI*, you may only change the appearance and enable state of parameters. Use *PF\_UpdateParamUI ()* from *PF\_ParamUtilSuite3* to update the UI, passing it a *copy* of the parameter you wish to modify. Do *not* attempt to modify the original. It is not necessary to set *PF\_OutFlag\_REFRESH\_UI*; *PF\_UpdateParamUI ()* handles that for you.

---

**Note:** This is the only way to update the UI of *PF\_PUI\_STD\_CONTROL\_ONLY* parameters.

---

### 36.2 Updating Parameter Values

A parameter's value (not just UI) can be modified during *PF\_Cmd\_USER\_CHANGED\_PARAM* and during *PF\_Cmd\_EVENT* (*PF\_Event\_DO\_CLICK*, *PF\_Event\_DRAG*, & *PF\_Event\_KEYDOWN*). After Effects will not honor changes made at other times.

When changing parameter *values* (and not just the UI), modify the original parameter, and set *PF\_Paramdef.uu.change\_flags* to *PF\_ChangeFlag\_CHANGED\_VALUE*.

This change will be also update the UI, and will be undoable by the user. Note that `PF_ChangeFlag_CHANGED_VALUE` isn't supported for layer parameters.

This suite is provided to give effect plug-ins some access to their parameter streams, without requiring AEGP suite usage. At least some of these functions are provided by several third-party hosts. These functions are especially handy for effects with supervised parameters.

---

### 36.3 PF\_ParamUtilSuite3

| Function              | Purpose   |
|-----------------------|---|
| PF_UpdateParamUI      | <pre>PF_UpdateParamUI (     PF_ProgPtr      effect_ref,     PF_ParamIndex   param_index,     const PF_ParamDef *defP);</pre> <p>Force After Effects to refresh the parameter’s UI, in the effect controls palette.</p> <p>Starting in CC 2014, After Effects will now honor a change to a custom UI height. Simply change the <code>ui_height</code> of your custom UI <code>PF_ParamDef</code> and then call <code>PF_UpdateParamUI</code>. The effect’s custom UI height will be updated in the Effect Control Window.</p> <p>Starting in CS6, when a plug-in disables a parameter, we now save that state in the UI flags so that the plug-in can check that flag in the future to see if it is disabled.</p> <p>NOTE: Never pass <code>param[0]</code> to this function.</p>  |
| PF_GetCurrentState    | <pre>PF_GetCurrentState (     PF_ProgPtr      effect_ref,     PF_ParamIndex   param_index,     const A_Time    *startPT0,     const A_Time    *durationPT0,     PF_State        *stateP);</pre> <p>This API, combined with <code>PF_AreStatesIdentical</code> below, lets you determine if a set of inputs (either layers, other properties, or both) are different between when you first called <code>PF_GetCurrentState</code> and a current call, so it can be used for caching. You can specify a range of time to consider or all of time.</p> <p>Updated in CS6 to add <code>param_index</code>, <code>startPT0</code>, and <code>durationPT0</code>. Pre-defined constants for <code>param_index</code> are as follows:</p> <ul style="list-style-type: none"> <li>• <code>PF_ParamIndex_CHECK_ALL</code> - check every parameter, including every layer referred to by a layer parameter.</li> <li>• <code>PF_ParamIndex_CHECK_ALL_EXCEPT_LAYER_PARAMS</code> - omit all layers. Pass a specific layer parameter index to include that as the only layer parameter tested.</li> <li>• <code>PF_ParamIndex_CHECK_ALL_HONOR_EXCLUDE</code> - Similar to <code>CHECK_ALL</code>, but honor <code>PF_ParamFlag_EXCLUDE_FROM_HAVE_INPUTS_CHANGED</code>.</li> </ul> <p>Passing in <code>NULL</code> for both <code>start</code> and <code>duration</code> indicates all time. For effects that do simulation across time and therefore set <code>PF_OutFlag2_AUTOMATIC_WIDE_TIME_INPUT</code>, when you ask about a time range, it will be expanded to include any times needed to produce that range.</p> <p>Populates a <code>PF_State</code>, an opaque data type used as a receipt for the current state of the effect’s parameters (the <code>PF_State</code> is used in our internal frame caching database).</p> |
| 124                   | <b>Chapter 36. Parameter Supervision</b>  |
| PF_AreStatesIdentical | <pre>PF_AreStatesIdentical (     PF_ProgPtr      effect_ref,     const PF_State  *stateIP,</pre>  |

---

## Global, Sequence, & Frame Data

---

After Effects allows plug-ins to store data at three scopes; global, sequence, and frame. Consider carefully where you store information; choosing poorly can impact performance, or make your plug-in confusing to the user.

Use global data for information common to all instances of the effect: static variables and data, bitmaps, pointers to other DLLs or external applications.

Store anything specific to this instance of your plug-in (UI settings, text strings, and any custom data not stored in parameters) in sequence data, Use After Effects' memory allocation functions.

Frame data is used for information specific to rendering a given frame. This has fallen into disuse, as most machines are capable of loading an entire frame into memory at a time. Of course, your IMAX-generating users will still appreciate any optimizations you can make.

---

### 37.1 Persistence

After Effects saves sequence data in the project file, but not global or frame data. Pointers within sequence data which point to external data are, in all likelihood, invalid upon reopening the project, and must be re-connected. We call this process “flattening” and “unflattening” the sequence data.

---

### 37.2 Validating Sequence Data

Careful sequence data validation is important for effects that do simulation across time, where frame N is dependent on frame N-1, and you use a cache of calculated data in your sequence data. If a parameter is changed, certain calculated data may no longer be valid, but it would also be wasteful to blindly recalculate everything after every change.

When asked to render frame N, assuming you have your cached data calculated up to frame N-1, call `PF_GetCurrentState()` / `PF_AreStatesIdentical()` from *PF\_ParamUtilSuite3* to see if the cache of calculated data is still valid given the current parameter settings.

The state of all parameters (except those with *PF\_ParamFlag\_EXCLUDE\_FROM\_HAVE\_INPUTS\_CHANGED* set), including layer parameters (including *param[0]*) are checked over the passed time span.

This is done efficiently, as the change tracking is done with timestamps.

If the inputs have not changed, you can safely use your cache, AND the internal caching system will assume that you have a temporal dependency on the passed range. So if something changes upstream, the host's caches will be properly invalidated automatically.

To test that it is working, apply your effect with one parameter keyframed on every frame. RAM Preview to fill the cache, then change one of the keyframes. The related frame and all dependent frames (e.g. later frames, in the case of a simulation) should lose their cache marks and require re-rendering. Similarly, upstream changes to sources of layer parameters should cause time-selective invalidation of the cache.

---

### 37.3 Flattened And Unflattened Sequence Data

If your sequence data references external memory (in pointers or handles), you must flatten and unflatten your data for disk-safe storage. This is analogous to creating your own miniature file format.

Upon receiving *PF\_Cmd\_SEQUENCE\_FLATTEN*, put data referenced by pointers into one contiguous block from which you can later recover the old structure.

If your sequence data contains a pointer to a long, allocate 4 bytes in which to store the flattened data. You must handle platform-specific byte ordering.

Remember, your users (the ones who bought two copies of your plug-in, anyway) may want the same project to work on macOS and Windows.

After Effects sends *PF\_Cmd\_SEQUENCE\_RESETUP* when the data is reloaded, for either flat or unflat data.

Use a flag at a common offset within both structures to indicate the data's state.

```
typedef struct {
    A_char*    messageZ;
    PF_FpLong  big_numF;
    void*      temp_storage;
} non_flat_data;

typedef struct {
    char       message[256];
    PF_FpLong  big_numF;
    A_Boolean  big_endianB;
} flat_data;
```

### 37.4 Resizing Sequence Data

During *PF\_Cmd\_SEQUENCE\_SETUP*, allocate a handle for data specific to this instance of your effect.

You may modify the contents, but not the size, of the sequence data during any selector.

You may resize the sequence data handle only during the following selectors:

- *PF\_Cmd\_AUDIO\_SETUP*

- PF\_Cmd\_AUDIO\_SETDOWN
- PF\_Cmd\_FRAME\_SETUP
- PF\_Cmd\_FRAME\_SETDOWN
- PF\_Cmd\_AUDIO\_RENDER
- PF\_Cmd\_RENDER
- PF\_Cmd\_SEQUENCE\_SETUP (**duh**)
- PF\_Cmd\_SEQUENCE\_SETDOWN
- PF\_Cmd\_SEQUENCE\_FLATTEN
- PF\_Cmd\_SEQUENCE\_RESETUP
- PF\_Cmd\_DO\_DIALOG

---

### Arbitrary Data Parameters

---

Some values are not adequately represented by After Effects existing parameter types. You can create and register any data for interpolation by After Effects, by creating parameters of arbitrary data type, or “arb data”. You can rely on our interpolation engine and parameter management, without having to force your data into a pre-defined parameter type.

We’ve created a new messaging structure for custom data types, which are easily conceptualized as member (and friend) functions of a C++ class. You must respond to all selectors detailed here if you use arb data.

These functions deal with custom data structure management. Your arb data will be unloaded and reloaded at the user’s whim; provide disk-safe flatten and unflatten functions.

---

## 38.1 Arbitrary Data Selectors

| Selector          | Response  |
|-------------------|---|
| PF_ArbAllocate    | Allocate, populate, and return a handle to a new instance of your arb data.   |
| PF_ArbFree        | Free and destroy an instance of your arbitrary data type.   |
| PF_ArbCopy        | Make a copy of an existing instance. You will be passed two handles, but only the source handle contains a valid instance. You must create a new instance, copy the values from the source, and put it in the destination handle. If you are passed a NULL handle, create a default instance of your arb data.  |
| PF_ArbFlatSize    | You'll be passed a handle to an instance of your data type, and a variable in which you return the size of a flattened version of that instance.  |
| PF_ArbFlat        | Flatten the instance you've passed, and place it in the supplied buffer. The buffer will be the size you reported in response to PF_Arbitrary_FLAT_SIZE_FUNC.   |
| PF_ArbUnpack      | Unpack the buffer into an instance of your arbitrary data type, and put in the handle which you've been passed.   |
| PF_ArbInterpolate | Your interpolation function is passed three handles to instances of your arbitrary data type; one containing initial values (0), one final values (1), and a third to hold your interpolated data (somewhere between 0 and 1). You are also passed a float indicating where, between 0 and 1, your interpreted value should be. Allocate an instance and fill it with interpolated data. Then put the interpolated instance into the handle you've been passed. The velocity curves have already been accounted for when the normalized time value was calculated.<br>NOTE: Never check out parameters if the <i>in_data&gt;effect_ref</i> is NULL. |
| PF_ArbCompare     | You are passed two instances of your arbitrary data, and a pointer to a comparison result. Populate the result with one of the values for PF_ArbCompareResult (see AE_Effect.h) to indicate whether the first was equal to, less than, more than, or simply not equal to the second.  |
| PF_ArbPrintSize   | Indicate the buffer size you require for printing your parameter's current values by setting print_sizePLu (member of print_size_func_params, part of the PF_ArbParamsExtra structure).   |
| PF_ArbFormat      | Format your arbitrary data for text-based export, and copy the result to the buffer. This can be as elaborate as you would like. Your plug-in should emulate the cut-and-paste behavior for pasting text representations of parameter settings (into a Microsoft Excel spreadsheet, for example) displayed by the plug-ins shipped with After Effects. You have a great deal of flexibility in how you format your output.  |
| PF_ArbParseText   | Given a buffer of text data (often from the system clipboard), parse it into your arbitrary data format.  |

## 38.2 Implementing Arbitrary Data

In addition to the normal command and event selector, arb data requires another set of host interaction. This is transparent for other parameter types, as After Effects manages their representing data. Writing an arb data plug-in will give you insight into the vast amount of parameter management After Effects performs, and the sequence in which those managing actions occur. It may even cause you to rethink your implementation, and use the parameter types After Effects manages *for* you.

Instantiate your arb data (using After Effects' memory allocation functions, of course) and point ParamDef.u.arb\_d.dephault at it. Populate it with appropriate default values. No value variable is required to set up the parameter; zero it out for safety's sake.

In your plug-in's entry function, include a case for handling *PF\_Cmd\_ARBITRARY\_CALLBACK*.

Invoke a secondary event handler, *HandleArbitrary*. It receives a PF\_ArbParamsExtra in extra, which in turn contains a PF\_FunctionSelector identifying the command sent.

Perhaps After Effects has sent `PF_Cmd_ARBITRARY_CALLBACK` and the `PF_FunctionSelector` is `PF_Arbitrary_COPY_FUNC`. Pointers to a source and destination Arb are provided in `PF_ArbParamsExtra.copy_func_params`. Allocate a new Arb, and point `dest_arbPH` at it. If `src_arbH` is `NULL`, create a default Arb for `dest_arbPH`.

The user may select the arb's keyframe data in the Timeline panel, copy it, then switch to another application. You will be sent a `PF_Arbitrary_PRINT_SIZE_FUNC`; set the size of your output buffer by setting `print_sizePLu` in the `PF_ArbParamsExtra`. You'll then receive `PF_Arbitrary_PRINT_FUNC`; populate the `print_bufferPC` output buffer with a textual representation of the Arb(s) in question.

Users may paste keyframe data into your Arb's timeline. You will receive `PF_Arbitrary_SCAN_FUNC`. Create an Arb based on the contents of the character buffer handed to you (its size is indicated in `print_sizeLu`).

---

## 38.3 Arbitrary Data? Re-Entrancy!

Your plug-in code *must* be recursively re-entrant to support custom data types, since it could be called by After Effects for numerous reasons. Your plug-in could check out a layer that, in turn, depends on another instance of your effect. Your plug-in's arbitrary data handling code will be triggered by your attempt to check out a (seemingly) unrelated layer. Watch out for calls to C run-time libraries that rely on static values accessed through global variables. If you're not prepared for this eventuality, you'll hang After Effects, and users will curse and punch their monitors.

---

## 38.4 When Not To Access Arbitrary Parameters

If `in_data>effect_ref` is `NULL`, do not check out arbitrary parameters.

---

## 38.5 Changes During Dialogs

After Effects ignores any changes made to arbitrary data parameters during `PF_Cmd_DO_DIALOG`.

This is by design; changes made during the display of the options dialog affect the entire effect stream, not just the arbitrary parameter at a given time.

If you must alter your arb's behavior based on these changes, save that information in sequence data and apply it later, often during `PF_Cmd_USER_CHANGED_PARAM`.

## Useful Utility Functions

### 39.1 PF\_EffectUISuite

Although not strictly concerned with parameters, this suite can change the name of the options button.

| Function                | Purpose   |
|-------------------------|---|
| PF_SetOptionsButtonName | <p>Changes the text on the options button in the effect controls palette.</p> <p>NOTE: This must be called during <i>PF_Cmd_PARAM_SETUP</i>.</p> <pre>PF_SetOptionsButtonName (     PF_ProgPtr    effect_ref,     const A_char  *nameZ);</pre> <p>nameZ may be up to A_char [31] in length.</p> |

### 39.2 PF\_AppSuite

Roughly 437 years ago, when we released After Effects 5.0, we published some useful utility callbacks in PF\_AppSuite. They're as useful today as they were then. After Effects has user-controllable UI brightness.

In addition to the *PF\_EffectCustomUIOverlayThemeSuite* for custom UI in effects, use these calls to integrate seamlessly into the After Effects UI.

What better way to shame someone into purchasing a copy of your plug-in than by putting their personal information into a watermark, eh? Or set the cursor to add mask vertices, just to confuse people? Heh heh heh. But that would be wrong.

| Function             | Purpose   |
|----------------------|---|
| PF_AppGetBgColor     | <p>Retrieves the current background color.</p> <pre>PF_AppGetBgColor (     PF_App_Color  bg_colorP);</pre>  |
| PF_AppGetColor       | <p>Retrieves the color for the specified UI element. See AE_EffectSuites.h for a complete enumeration of available PF_App_Color values; basically any color in After Effects' UI can be retrieved. CC adds several new PF_App_ColorType enum values for new elements that can be queried. Note that in CS6, the color definitions are off from FILL_LIGHT downward. Use following psuedocode for CS6 only:</p> <pre>GetColor (enum e) {     if host_is_CS6 and e &gt;= FILL_LIGHT         e += 3         call real GetColor }</pre> <pre>PF_AppGetColor (     PF_App_ColorType  color_type,     PF_App_Color      *app_colorP);</pre> |
| PF_AppGetLanguage    | <p>New in CC. Retrieves the active displayed language of AE UI so plug-in can match. Here are the possible language codes as of CC:</p> <ul style="list-style-type: none"> <li>• Chinese - zh_CN</li> <li>• English - en_US</li> <li>• French - fr_FR</li> <li>• German - de_DE</li> <li>• Italian - it_IT</li> <li>• Japanese - ja_JP</li> <li>• Korean - ko_KR</li> <li>• Spanish - es_ES</li> </ul> <pre>PF_AppGetLanguage (     A_char  lang_tagZ);</pre>   |
| PF_GetPersonalInfo   | <p>Retrieves the user's registration information.</p> <pre>PF_GetPersonalInfo (     PF_AppPersonalTextInfo  *ptiP);</pre> <pre>typedef struct PF_AppPersonalTextInfo {     A_char  name[PF_APP_MAX_PERS_LEN + 1];     A_char  org[PF_APP_MAX_PERS_LEN + 1];     A_char  serial_str[PF_APP_MAX_PERS_LEN + 1]; } PF_AppPersonalTextInfo;</pre>  |
| PF_GetFontStyleSheet | <p>Retrieves font style sheet information for the fonts used in After Effects' UI. Trivia: The font used in After Effects' UI starting in 15.0 is Adobe Clean. Before that, it was Tahoma on Windows and Lucida Grande on macOS X.</p> <pre>PF_GetFontStyleSheet (</pre>  |
| 134                  | <p>PF_FontStyleSheet sheet, PF_FontName *font_nameP0, A_short *font_numPS0, A_short *sizePS0, A_short *stylePS0);</p> <p style="text-align: right;"><b>Chapter 39. Useful Utility Functions</b></p>   |

## 39.3 Advanced Appsuite: You Can Do That?!

`PF_AdvAppSuite` was originally designed for some pretty nefarious purposes; an external application was pretending to be an After Effects plug-in, and required ways to notify After Effects of the changes it had made to the project. Our API impurity is your gain.

---

## 39.4 PF\_AdvAppSuite2

| Function                     | Purpose  |
|------------------------------|--|
| PF_SetProjectDirty           | Tells After Effects that the project has been changed since it was last saved.<br><br>PF_SetProjectDirty (void);   |
| PF_SaveProject               | Saves the project to the current path. To save the project elsewhere, use <i>AEGP_SaveProjectToPath()</i> .<br><br>PF_SaveProject (void);  |
| PF_SaveBackgroundState       | Stores the background state (After Effects' position in the stacking order of open applications and windows).<br><br>PF_SaveBackgroundState (void);  |
| PF_ForceForeground           | Brings After Effects to the front of all currently open applications and windows.<br><br>PF_ForceForeground (void);  |
| PF_RestoreBackgroundState    | Puts After Effects back where it was, in relation to other applications and windows.<br><br>PF_RestoreBackgroundState (void);  |
| PF_RefreshAllWindows         | Forces all After Effects windows to update. Note that although the Composition panel will be refreshed, this does not guarantee a new frame will be sent to External Monitor Preview plug-ins.<br><br>PF_RefreshAllWindows (void);   |
| PF_InfoDrawText              | Writes text into the After Effects info palette.<br><br>PF_InfoDrawText (<br>const A_char *line1Z0,<br>const A_char *line2Z0);   |
| PF_InfoDrawColor             | Draws the specified color in the After Effects info palette (alpha is ignored).<br><br>PF_InfoDrawColor (<br>PF_Pixel color);  |
| PF_InfoDrawText3             | Writes three lines of text into the After Effects info palette.<br><br>PF_InfoDrawText3 (<br>const A_char *line1Z0,<br>const A_char *line2Z0,<br>const A_char *line3Z0);   |
| PF_InfoDrawText3Plus         | Writes three lines of text into the After Effects info palette, with portions of the second and third lines left and right justified.<br><br>PF_InfoDrawText3Plus (<br>const A_char *line1Z0,<br>const A_char *line2_jrZ0,<br>const A_char *line2_jlZ0,<br>const A_char *line3_jrZ0,<br>const A_char *line3_jlZ0); |
| <b>39.4. PF_AdvAppSuite2</b> | <b>137</b>   |
| PF_AppendInfoText            | Appends characters to the currently-displayed info text.   |

## 39.5 Formatting Time

`PF_AdvTimeSuite` provides several functions to match how After Effects displays time. In fact, these are the same functions we use internally.

## 39.5.1 PF\_AdvTimeSuite4

| Function                | Purpose   |
|-------------------------|---|
| PF_FormatTimeActiveItem | <p>Given a time value and scale, returns a formatted string representing that time. If durationB is TRUE, appropriate units will be appended.</p> <pre>PF_FormatTimeActiveItem(   A_long      time_valueUL,   A_u_long    time_scaleL,   PF_Boolean  durationB,   A_char      *time_buf);</pre>   |
| PF_FormatTime           | <p>Contextualizes the formatted time string for the given PF_InData and PF_EffectWorld (i.e., layer time).</p> <pre>PF_FormatTime(   PF_InData      *in_data,   PF_EffectWorld *world,   A_long         time_valueUL,   A_u_long       time_scaleL,   PF_Boolean     durationB,   A_char        *time_buf);</pre>   |
| PF_FormatTimePlus       | <p>Allows you to select composition or layer time.</p> <pre>PF_FormatTimePlus(   PF_InData      *in_data,   PF_EffectWorld *world,   A_long         time_valueUL,   A_u_long       time_scaleL,   PF_Boolean     comp_timeB,   PF_Boolean     durationB,   A_char        *time_buf);</pre>  |
| PF_GetTimeDisplayPref   | <p>Returns the starting frame number (specified by the user in composition settings), and the composition's time display preferences. Updated in 14.2 to support higher frame rates.</p> <pre>PF_GetTimeDisplayPref(   PF_TimeDisplayPref2 *tdp,   A_long              *starting_num); <b>typedef struct</b> {   A_char      display_mode;   A_long      framemax;   A_long      frames_per_foot;   A_char      frames_start;   A_Boolean   nondrop30B;   A_Boolean   honor_source_   ↪timecodeB;   A_Boolean   use_feet_framesB; } PF_TimeDisplayPrefVersion3;</pre> |
| PF_TimeCountFrames      | <p>New in 15.0. Returns the index of the frame in the current comp.</p> <pre>PF_TimeCountFrames(   <b>const</b> A_Time *start_timeTP,   <b>const</b> A_Time *time_stepTP,   A_Boolean   include_partial_frameB,   A_long      *frame_countL);</pre>   |

## 39.6 Affecting The Timeline

Long ago, we helped a developer integrate their stand-alone tracker with After Effects by exposing a set of functions to give them some way to notify us of, and be notified of, changes to the timeline.

With the numerous AEGP API calls available, these aren't used much, but they're still available.

Don't confuse this suite with *AEGP\_ItemSuite*.

### 39.6.1 PF\_AdvItemSuite1

| Function                   | Purpose   |
|----------------------------|---|
| PF_MoveTimeStep            | Moves current time num_stepsL in the specified direction.<br><br><pre>PF_MoveTimeStep(   PF_InData      *in_data,   PF_EffectWorld *world,   PF_Step        time_dir,   A_long         num_stepsL);</pre>   |
| PF_MoveTimeStepActiveItem  | Moves num_stepsL in the specified direction, for the active item.<br><br><pre>PF_MoveTimeStepActiveItem(   PF_Step time_dir,   A_long  num_stepsL);</pre>   |
| PF_TouchActiveItem         | Tells After Effects that the active item must be updated.<br><br><pre>PF_TouchActiveItem (void);</pre>  |
| PF_ForceRerender           | Forces After Effects to rerender the current frame.<br><br><pre>PF_ForceRerender(   PF_InData      *in_data,   PF_EffectWorld *world);</pre>  |
| PF_EffectIsActiveOrEnabled | Returns whether the effect which owns the PF_ContextH is currently active or enabled (if it isn't, After Effects won't be listening for function calls from it).<br><br><pre>PF_EffectIsActiveOrEnabled(   PF_ContextH contextH,   PF_Boolean  *enabledPB);</pre> |

## 39.7 Accessing Auxiliary Channel Data

Some file types contain more than just pixel data; use `PF_ChannelSuite` to determine whether such information is present, and the macros in `AE_ChannelSuites.h` to retrieve it in the format you need.

---

### 39.7.1 PF\_ChannelSuite1

| Function                            | Purpose  |
|-------------------------------------|--|
| PF_GetLayerChannelCount             | <p>Retrieves the number of auxiliary channels associated with the indexed layer.</p> <pre>PF_GetLayerChannelCount (   PF_ProgPtr    effect_ref,   PF_ParamIndex param_index,   A_long        *num_channelsP);</pre>  |
| PF_GetLayerChannelIndexedRefAndDesc | <p>Retrieves (by index) a reference to, and description of, the specified channel.</p> <pre>PF_GetLayerChannelIndexedRefAndDesc (   PF_ProgPtr    effect_ref,   PF_ParamIndex param_index,   PF_ChannelIndex channel_index,   PF_Boolean    *foundPB,   PF_ChannelRef *channel_refP,   PF_ChannelDesc *channel_descP);</pre>   |
| PF_GetLayerChannelTypedRefAndDesc   | <p>Retrieves an auxiliary channel by type. Returned information is valid only if foundPB returns TRUE.</p> <pre>PF_GetLayerChannelTypedRefAndDesc (   PF_ProgPtr    effect_ref,   PF_ParamIndex param_index,   PF_ChannelType channel_type,   PF_Boolean    *foundPB,   PF_ChannelRef *channel_refP,   PF_ChannelDesc *channel_descP);</pre> <p><b>PF_DataType</b> will be one of the following:</p> <ul style="list-style-type: none"> <li>• PF_DataType_FLOAT - 34 bytes</li> <li>• PF_DataType_DOUBLE - 38 bytes</li> <li>• PF_DataType_LONG - 34 bytes</li> <li>• PF_DataType_SHORT - 32 bytes</li> <li>• PF_DataType_FIXED_16_16 - 34 bytes</li> <li>• PF_DataType_CHAR - 31 byte</li> <li>• PF_DataType_U_BYTE - 31 byte</li> <li>• PF_DataType_U_SHORT - 32 bytes</li> <li>• PF_DataType_U_FIXED_16_16 - 34 bytes</li> <li>• PF_DataType_RGB - 3 bytes</li> </ul> <p><b>PF_ChannelType</b> will be one of the following:</p> <ul style="list-style-type: none"> <li>• PF_ChannelType_DEPTH</li> <li>• PF_ChannelType_NORMALS</li> <li>• PF_ChannelType_OBJECTID</li> <li>• PF_ChannelType_MOTIONVECTOR</li> <li>• PF_ChannelType_BK_COLOR</li> <li>• PF_ChannelType_TEXTURE</li> <li>• PF_ChannelType_COVERAGE</li> <li>• PF_ChannelType_NODE</li> <li>• PF_ChannelType_MATERIAL</li> <li>• PF_ChannelType_UNCLAMPED</li> <li>• PF_ChannelType_UNKNOWN</li> </ul> |

## CHAPTER 40

---

### Motion Blur

---

Effects handle their own motion blur, using *PF\_InData>shutter\_angle* along with *PF\_InData>shutter\_phase*.

The plug-in must set *PF\_OutFlag\_I\_USE\_SHUTTER\_ANGLE* so After Effects knows it needs this information.

They must *check out* their own parameters at other times to examine their change over the shutter interval.

If the plug-in checks out parameters outside this interval, set *PF\_OutFlag\_WIDE\_TIME\_INPUT*.

Doing so allows After Effects to compare the parameters within the sampling interval, and determine if they've changed.

### 41.1 Accessing Path Data

Paths differ from other parameter types, in that their values are not directly accessible. In addition to checking them out and in (like layer parameters), you must use our path data function suites to obtain the details of the path at a given time. See *PF\_PathQuerySuite1* and *PF\_PathDataSuite*. Never use the values present in a path parameter when it's passed to you, without first checking it out; while deleted paths will not be available, further updating is done “lazily” (later); your effect won't see these changes unless it checks out the path.

---

### 41.2 Manipulating Path Data

You can also use the *AEGP\_MaskOutlineSuite3* to manipulate paths. See *Cheating Effect Usage of AEGP Suites*. Path parameters are treated as opaque blobs of data; get and set functions must be used to access and manipulate them. Like layer parameters, they must be checked out (and in!) by effects which access them.

---

### 41.3 Vertices

Path vertices are more complex than simple points. All member variables are *PF\_FpLongs* (doubles), and are in the layer's coordinate space.

---

## 41.4 PF\_PathVertex

| Member    | Description                 |
|-----------|-----------------------------|
| x         | The location of the vertex. |
| y         |                             |
| tan_in_x  | The incoming tangent point. |
| tan_in_y  |                             |
| tan_out_x | The outgoing tangent point. |
| tan_out_y |                             |

---

## 41.5 PF\_PathDataSuite

This suite provides information about paths (sequences of vertices).

| Function                | Description   |
|-------------------------|---|
| PF_PathIsOpen           | <p>Returns TRUE if the path is not closed (if the beginning and end vertex are not identical).</p> <pre>PF_PathIsOpen (   PF_ProgPtr      effect_ref0,   PF_PathOutlinePtr pathP,   PF_Boolean      *openPB);</pre>   |
| PF_PathNumSegments      | <p>Retrieves the number of segments in the path. N segments means there are segments [0..N-1]; segment J is defined by vertex J and J+1.</p> <pre>PF_PathNumSegments (   PF_ProgPtr      effect_ref0,   PF_PathOutlinePtr pathP,   A_long          *num_segmentsPL);</pre>  |
| PF_PathVertexInfo       | <p>Retrieves the PF_PathVertex for the specified path. The range of points is [0..num_segments]; for closed paths, vertex[0] == vertex[num_segments].</p> <pre>PF_PathVertexInfo (   PF_ProgPtr      effect_ref0,   PF_PathOutlinePtr pathP,   A_long          which_pointL,   PF_PathVertex   *vertexP);</pre>   |
| PF_PathPrepareSegLength | <p>This fairly counter-intuitive function informs After Effects that you're going to ask for the length of a segment (using PF_PathGetSegLength below), and it'd better get ready. frequencyL indicates how many times you'd like us to sample the length; our internal effects use 100.</p> <pre>PF_PathPrepareSegLength (   PF_ProgPtr      effect_ref0,   PF_PathOutlinePtr pathP,   A_long          which_segL,   A_long          frequencyL,   PF_PathSegPrepPtr *lengthPrepPP);</pre> |
| PF_PathGetSegLength     | <p>Retrieves the length of the given segment.</p> <pre>PF_PathGetSegLength (   PF_ProgPtr      effect_ref0,   PF_PathOutlinePtr pathP,   A_long          which_segL,   PF_PathSegPrepPtr *lengthPrepP0,   PF_FpLong       *lengthPF);</pre>   |
| PF_PathEvalSegLength    | <p>Retrieves the location of a point lengthF along the given path segment.</p> <pre>PF_PathEvalSegLength (   PF_ProgPtr      effect_ref0,   PF_PathOutlinePtr pathP,   PF_PathSegPrepPtr *lengthPrepPP0,   A_long          which_segL,   PF_FpLong       lengthF,   PF_FpLong       *x,   PF_FpLong       *y);</pre>  |

**41.5. PF\_PathDataSuite**

PF\_PathEvalSegLengthDeriv1

Retrieves the location, and the first derivative, of a point lengthF along the given path segment. If you're not sure why you'd ever need this, don't use it. Math is hard.

## 41.6 PF\_PathQuerySuite1

This suite is used to identify and access the paths associated with the effect's source layer.

| Function        | Purpose   |
|-----------------|---|
| PF_NumPaths     | <p>Retrieves the number of paths associated with the effect's source layer.</p> <pre>PF_NumPaths(   PF_ProgPtr  effect_ref,   A_long      *num_pathsPL);</pre>  |
| PF_PathInfo     | <p>Retrieves the PF_PathID for the specified path.</p> <pre>PF_PathInfo(   PF_ProgPtr  effect_ref,   A_long      indexL,   PF_PathID   *unique_idP);</pre>  |
| PF_CheckoutPath | <p>Acquires the PF_PathOutlinePtr for the path at the specified time.</p> <pre>PF_CheckoutPath(   PF_ProgPtr      effect_ref,   PF_PathID       unique_id,   A_long          what_time,   A_long          time_step,   A_u_long        time_scale,   PF_PathOutlinePtr *pathPP);</pre>  |
| PF_CheckinPath  | <p>Releases the path back to After Effects. Always do this, regardless of any error conditions encountered. Every checkout must be balanced by a checkin, or pain will ensue.</p> <pre>PF_CheckinPath(   PF_ProgPtr      effect_ref,   PF_PathID       unique_id,   PF_Boolean      changedB,   PF_PathOutlinePtr pathP);</pre> |

---

### Accessing Camera & Light Information

---

Using functions provided in the *AEGP\_PFInterfaceSuite*, effects can access camera and lighting information for the layer to which they're applied; see the Resizer sample.

You can also use many of the other functions from *AE\_GeneralPlug.h*; the possibilities are vast.

---

## Color Space Conversion

---

Different pixel formats are useful for different operations. After Effects exposes its internal functions through `PF_ColorCallbacksSuite`. Here are the supported formats.

---

### 43.1 Pixel Types For Different Color Spaces

| Pixel Type  | Data Structure   |
|---|--|
| 8 bpc ARGB  | <pre>typedef struct {     A_u_char alpha, red, green, blue; } PF_Pixel8;</pre>                   |
| 16 bpc ARGB   | <pre>typedef struct {     A_u_short alpha, red, green, blue; } PF_Pixel16;</pre>                 |
| 32 bpc ARGB   | <pre>typedef struct {     PF_FpShort alpha, red, green, blue; } PF_PixelFloat, PF_Pixel32;</pre> |
| HLS (Hue, Lightness, Saturation)                              | <pre>typedef PF_Fixed PF_HLS_PIXEL[3]</pre>  |
| YIQ (luminance, in-phase chrominance, quadrature chrominance) | <pre>typedef PF_Fixed PF_YIQ_PIXEL[3]</pre>  |

---

Plug-ins can draw on image processing algorithms written for nearly any color space by using the following callback functions.

## 43.2 Color Space Conversion Callbacks

| Function   | Purpose   | Replaces      |
|------------|---|---------------|
| RGB to HLS | Given an RGB pixel, returns an HLS (hue, lightness, saturation) pixel. HLS values are scaled from 0 to 1 in fixed point.  | PF_RGB TO_HLS |
| HLS to RGB | Given an HLS pixel, returns an RGB pixel.   | PF_HLS TO_RGB |
| RGB to YIQ | Given an RGB pixel, returns a YIQ (luminance, inphase chrominance, quadrature chrominance) pixel. Y is 0 to 1 in fixed point, I is -0.5959 to 0.5959 in fixed point, and Q is -0.5227 to 0.5227 in fixed point. | PF_RGB TO_YIQ |
| YIQ to RGB | Given a YIQ pixel, returns an RGB pixel.  | PF_YIQ TO_RGB |
| Luminance  | Given an RGB pixel, returns 100 times its luminance value (0 to 25500).   | PF_LUMINANCE  |
| Hue        | Given an RGB pixel, returns its hue angle mapped from 0 to 255, where 0 is 0 degrees and 255 is 360 degrees.  | PF_HUE        |
| Lightness  | Given an RGB pixel, returns its lightness value (0 to 255).   | PF_LIGHTNESS  |
| Saturation | Given an RGB pixel, returns its saturation value (0 to 255).  | PF_SATURATION |

---

## Changing Parameter Orders, the Nice Way

---

It is possible to add or remove parameters from a plug-in, without forcing users to re-apply all instances of that plug-in to use the updated version. However, some advance planning on your part is necessary to allow for such changes. Your users (and technical support staff) will appreciate the effort.

You must first create a parameter array index. During *PF\_Cmd\_PARAM\_SETUP*, assign index values to each parameter as you add them, using a simple enumeration. The order of enumeration corresponds to the order in which the parameters are registered during *PF\_Cmd\_PARAM\_SETUP*, which in turn determines the order in which they appear in the Effect Control and Timeline panels.

Create another enumeration for disk IDs. The order of this enumeration must *not* be changed, though you may add to the end of this list. Note that the order of this list need not correspond with that of the parameter array index. Parameter disk IDs should range from 1 to 9999. Why not zero? Long story. . .

*In the early “wild west” days of After Effects plug-in programming, it was fairly common for developers not to bother with setting IDs. After Effects, realizing this, checked the ID of the first parameter added by that effect; if it was zero, it was assumed that the programmer hadn’t bothered to ID params; After Effects then assigned each its own ID. This assumption works fine if you never set param IDs, but not so well if you start numbering your IDs from NULL. That’s why.*

Before calling *PF\_ADD\_PARAM()*, specify the disk ID in the *PF\_ParamDef.uu.id* field. If no value is specified, After Effects makes parameters sequential starting with 1. The parameter’s information is tagged with this ID when saved. In this way, After Effects can still understand that, although your “Foobarocity” slider is now the fourth parameter passed, it’s the same parameter as when it was second.

To delete a parameter without forcing re-application, remove the code which creates it and its entry in the parameter array index list. However, *do not* remove its entry in the disk ID list. To add a new parameter, add an entry in the appropriate location in the parameter array indices list, add the parameter creation code, and append the disk ID to the end of the disk ID enumeration. To re-order, change the parameter array index list and reorder the parameter creation code appropriately.

---

## 44.1 Change defaults? Change IDs

If you don't, if someone saves a project with the old default and then reads it in with the new effect installed, that parameter will change to the new default value.

Presto! Instant support call.

This is another prime use case for `PF_ParamFlag_USE_VALUE_FOR_OLD_PROJECTS` from *Parameter Flags*.

### 45.1 Best Practices

If your prototypes are anything like ours, the first version of your plug-in that runs without crashing differs radically from the version that actually ships.

How your plug-in responds to things like downsampling, errors and exceptions, pixel aspect ratio, out-of-memory situations, and being interrupted while processing determines how usable it is (and how many support requests you'll have to handle).

---

### 45.2 Responsiveness

Make your plug-ins as responsive as possible using `PF_ABORT()` and `PF_PROGRESS()` from *Interaction Callbacks*.

We actually test all our effects for interruptability; you'd be surprised how cranky users can get waiting for your pokey effect to finish processing a film resolution sequence!

After Effects' iteration functions inherently provide this functionality; you don't need to worry about calling the above functions from within your pixel processing functions.

---

### 45.3 Make Your Effect Easy To Find

It's possible to have your effect show up in the "Effects & Presets" palette when users search for something other than the plug-in's name.

Apply your effect (leaving the settings at default, unless you're very certain the user will want something different when they search for the given term), and select "Save selection as animation preset" from the effect controls palette.

---

Save it to the name by which you want users to find the plug-in.

Have your plug-in's installer put the resultant .ffx file into the \Presets directory, next to the After Effects executable.

Your preset will show up when users search for the name to which it was saved.

---

## 45.4 Sampling Pixels At (x,y)

Sometimes, instead of just processing every pixel, you'll want to get to a specific offset within the input frame. Below is one way to sample the pixel at a given (x,y) location; similar code could be used to write to the given location.

```
PF_Pixel *sampleIntegral32(PF_EffectWorld &def, int x, int y){
    return (PF_Pixel*)((char*)def.data +
        (y * def.rowbytes) +
        (x * sizeof(PF_Pixel)));
}

PF_Pixel16 *sampleIntegral64(PF_EffectWorld &def, int x, int y){
    assert(PF_WORLD_IS_DEEP(&def));
    return (PF_Pixel16*)((char*)def.data +
        (y * def.rowbytes) +
        (x * sizeof(PF_Pixel16)));
}
```

Special thanks to Paul Miller for answering this question.

---

## 45.5 Where's The Center Of A Pixel?

Deeeeep, man. After Effects rotates around the upper left corner of the upper left pixel when the anchor point (see User Documentation) is (0,0).

However, the subpixel sample and area sample callbacks actually treat (.0, .0) as a direct hit. To compensate for this, subtract 0.5 from x and y values before calling those functions.

The matrix functions (`transform_world` from *PF\_WorldTransformSuite1*) don't have this problem.

When translating an image by a subpixel amount, make the output layer one pixel wider than its input, and leave the origin at (0,0).

---

## 45.6 Text Layer Origin

Almost all layer types have their origin in the upper-left corner. Not so with text layers!

A text layer origin by default is at the bottom-left baseline position of the first character. You can see this if you create a text item and then pick the layer so the anchor point shows up.

Look at where the default anchor point location is. The transform is not at the corner of the layer rectangle.

---

## 45.7 Clean Slate

You don't necessarily begin effect processing with a clean output slate. Our Gaussian blur filter, in an effort to do so, performs the following before rendering:

```
src_rect.left   = in_data>output_origin_x;
src_rect.right  = src_rect.left + input>width;
src_rect.top    = in_data>output_origin_y;
src_rect.bottom = src_rect.top + input>height;

err = PF_FILL(NULL, NULL, output);

if (!err) {
    err = PF_COPY(&params[0]>u.ld, output, NULL, &src_rect);
}
```

## 45.8 Caching Behavior

After Effects provides numerous ways to specify caching behavior. `PF_OutFlag_NON_PARAM_VARY`, `PF_OutFlag_WIDE_TIME_INPUT`, `PF_OutFlag_I_USE_SHUTTER_ANGLE`, `PF_OutFlag_I_SYNTHESIZE_AUDIO`, `PF_OutFlag2_I_USE_3D_CAMERA`, and `PF_OutFlag2_I_USE_3D_LIGHTS` (all from *PF\_OutFlags*) all influence caching decisions.

Supporting *dynamic outflags* can greatly improve performance, preventing After Effects from invalidating your effect's cache as aggressively as it otherwise would.

Confirm that your plug-in performs well with different After Effects cache settings. Does your plug-in get called to update as often as expected, or does After Effects think it has valid pixels when you think it doesn't?

## 45.9 Global Performance Cache Considerations

With the new caching in CS6, you may need to clear cached frames after changing your effect's rendering, so that frames rendered and stored in the cache prior to the change will not be reused. To do so manually during development:

- 1) In Preferences > Media & Disk Cache, disable the Disk Cache
- 2) Click "Empty Disk Cache" just to be sure (disabling the Disk Cache in step 1 only disables the *writing* of disk cache, not necessarily the usage)
- 3) Relaunch

If you ever encounter a glitch, it likely a legitimate bug in your effect, such as improper rectangle handling in SmartFX.

On the other hand, if you fix a rendering bug in your plug-in and ship an update, you can't expect all users will empty their disk caches. A user may have a disk cache of the buggy frame and it needs to be invalidated. What to do? Update your plug-in's effect version. This value (and the AE build number) is part of the cache key, so if you update it any frames cached containing content from your plug-in will no longer match.

## 45.10 Some Thoughts On Time From A Long-Time Developer

Stoney Ballard put together the following summary of how time works with effects; you may find it helpful.

There are five `in_data` parameters that describe time to a filter:

- `current_time`
- `time_step`
- `local_time_step`
- `total_time`
- `time_scale`

Their values are dependent on:

- The frame being rendered
- The duration of the layer and composition The frame rate of the comp
- Any Time Stretch Any Time Remapping
- The time behavior of an outer composition (one enclosing the composition with the layer being filtered)
- The setting of the “Preserve frame rate when nested or in render queue” (PFR) switch

The frame being rendered affects `current_time`. It is expressed in the local (layer) time system. If the PFR switch is off, `current_time` may be any non-negative value. If on, it will be restricted to a multiple of `time_step` and `local_time_step`. Layer duration affects only `total_time`. Comp duration is a factor only when Time Remapping (TR) is on. In that case, `total_time` is the larger of layer duration and composition duration. Composition frame rate affects only the `time_scale`. Time Stretch affects only `time_step` and `local_time_step`. If the time stretch is negative, these values are negative. Even if the layer’s duration (as seen in

the comp) changes, `total_time` remains unaffected. This works as if Time Stretch was *above* a filter, but *below* an outer comp. PFR does not alter the effect of Time Stretch. Time Stretch is different than an outer comp, since it affects both step params equally, while an outer comp affects only `time_step`.

Time Remapping happens *below* the filter, so that it does not affect the time params other than the `total_time`. When TR is on, the layer is lengthened to the same as the comp (but never shortened), regardless of how much time it actually takes, or where in the comp the layer is. This may cause `total_time` to be larger. It has nothing to do with the actual time map, just whether or not it’s enabled.

The biggest variation comes from being nested in an outer comp, unless PFR is on. When PFR is on, a filter is completely isolated from time variations in an outer comp. Of course, `current_time` will not necessarily move in increments of `time_step` in that case. It may skip frames or go backwards.

When PFR is off, `local_time_step`, `total_time`, and `time_scale` remain set to what they were for the inner comp, but `time_step` contains the time to the next frame in the outer comp, expressed in the local time system. This may be any value, including 0. This can be interpreted as an instantaneous time rate, rather than a duration. A 0 value can last for an arbitrary number of rendered frames, but the `current_time` won’t change on the local layer.

Looked at from the other direction:

`current_time` is quantized to `time_step` intervals unless rendering an outer comp with PFR off for the inner comp. This is the current time in the layer, not in any comp.

The value of `local_time_step` is affected only by Time Stretch. It can never be zero, but it can be negative.

`time_step` and `local_time_step` are always the same value unless rendering an outer comp with PFR off. `time_step` is also affected by the time behavior of an outer comp (with PFR off). It can have any value, positive, negative, or zero, and can be different for every frame (of the outer comp). `time_step` can be used to determine the duration of the current frame (with PFR off).

`total_time` is the duration of the layer, unless Time Remapping is on, which makes it the larger of the layer duration and the duration of the comp.

`time_scale` is the scale such that `total_time / time_scale` is the layer duration in seconds in its comp. It is affected only by the comp frame rate, although presumably all the time values could be scaled proportionately for any reason.

A layer's intrinsic frame rate (if it has one) is not visible anywhere, although it's usually the same as the comp frame rate. If a filter needs to access the actual frames of a clip, it can do so

only by being in a comp of the same frame rate, and with no Time Stretch or Time Remapping applied to its layer. It should use `local_time_step` to determine where the frames are.

---

## 45.11 Rate x Time == Pain!

Be careful if one of your parameters is a speed or velocity parameter. Consider the ripple effect. It assumes a constant and uses the current time to determine how far along the ripple has gone ( $d = v * t$ ). If the user interpolates the speed over time, you should integrate the velocity function from time zero to the current time. Ripple does *not* do this, but provides a “phase” parameter that the user can interpolate as they wish, providing correct results as long as the speed is set to zero. If you want to provide the correct behavior, you can sample (and integrate) the speed parameter from the beginning of time until the current time using `PF_CHECKOUT_PARAM()`, or you can provide a “phase” or “distance” parameter and warn the user about interpolating the speed. The cost of checking out many parameter values is negligible compared to rendering, and is the recommended approach.

If you check out parameter values at other times, or use layer parameters at all, you *must* check in those parameters when finished, even if an error has occurred. Remember, checked-out parameters are read-only.

---

## 45.12 Testing

Try using your plug-in in RAM previews to ensure you handle out-of-memory conditions gracefully. Does your plug-in handle running out of memory gracefully?

If you receive `PF_Err_OUT_OF_MEMORY` (from *Error Codes*) when requesting memory, do you pass it back to After Effects?

What happens when your video effect is applied to an audio-only layer? Test with projects created using older versions of your plug-in.

The SmartFX API provides bidirectional communication between effects and After Effects, enabling many performance optimizations and providing previously unavailable dependency information. This extension of the effect API is the way to implement 32-bit per channel support in After Effects.

Normal effect plug-ins are given a full-sized input buffer, and asked to render a full-sized output buffer. While output *extent\_hint* specifies the portion of the output buffer that must actually be filled, this scheme is still very inefficient if the effect does not need its entire input. Also, many effects don't use extent hints.

---

## 46.1 The Way Things Were

Consider a blur effect applied to a huge layer which is mostly off-screen, or viewed through a small region of interest, or masked down to a small size. Only a small section of the output needs to be rendered, indicated to the effect using the output *extent\_hint*. Only a small section of the input to be blurred is needed as well - the output *extent\_hint* expanded by the blur radius. However, using the legacy effects API, there is no way for After Effects to know this, so the entire layer is passed to the plug-in. These extra pixels can be extremely expensive and wasteful to compute, especially in the case of prior effects or nested comps.

---

## 46.2 The Way Things Are Now

SmartFX solves this problem by reversing the calling sequence. The effect is told how much of its output is required, and must explicitly *ask* the host for the inputs it needs. The render process is split into two parts: pre-render and render.

During pre-render, the effect describes the input pixel data it needs; this necessary input can vary based on anything you like (non-input layer parameters, non-layer parameters, information from *in\_data*, settings in sequence data...). The effect must also return the extent of the resulting output, which may be smaller than the requested size if there are empty pixels in the requested portion of the layer.

During the render stage, the effect can *only* retrieve pixels that it has previously requested. This two-pass approach facilitates many important optimizations. For example, an effect which multiplies or mattes one input against another might discover that its first input is not

needed at all, if the mask does not intersect it. There are also important optimizations that are performed internally by After Effects to ensure that image buffers are copied as little as possible, and these optimizations are only possible after the host knows the buffer sizes and for all inputs and outputs.

Like AEGPs, SmartFX plug-ins are never unloaded by After Effects.

---

## 46.3 Content Bounds

The content bounds of a node are the largest possible result rectangle that can be returned from a call to `PreRender`. It absolutely cannot vary depending on current render request or anything else. It should be calculated carefully, not loosely.

This calculation is very important. It is an intrinsic property of the node (and its inputs) and is fixed once the graph is built. Violation of it can and probably will cause all sorts of problems in various pieces of code.

---

## 46.4 How To Smartify

Effects which set `PF_OutFlag2_SUPPORTS_SMART_RENDER` (from *PF\_OutFlags*) will receive the SmartFX calls `PF_Cmd_SMART_PRE_RENDER` and `PF_Cmd_SMART_RENDER` (from *Frame Selectors*), instead of the older `PF_Cmd_FRAME_SETUP` / `PF_Cmd_RENDER` / `PF_Cmd_FRAME_SETDOWN` sequence. To preserve compatibility with non-smartified hosts, you may want to continue supporting the older commands too.

---

## 46.5 PF\_Cmd\_SMART\_PRE\_RENDER

After Effects requests output from the effect. The effect tells After Effects what input it needs to generate that output, through the use of callback functions, and by manipulating the structures in the extra parameter. An effect cannot access the pixels of any layer inputs it has not checked out during `PF_Cmd_SMART_PRE_RENDER`. So all layer inputs that an effect might possibly need must be checked out in advance using `checkout_layer`. If an effect might need certain layer inputs, they must be checked out now, even if later during rendering the effect may decide that the layer isn't needed. Also, since no parameter array is passed to SmartFX during `PF_Cmd_SMART_PRE_RENDER` or `PF_Cmd_SMART_RENDER`, any non-layer parameters needed must be retrieved using `PF_CHECKOUT_PARAM` (from *Interaction Callbacks*)

---

## 46.6 PF\_PreRenderExtra

| Member                | Purpose   |
|-----------------------|---|
| PF_PreRenderInput     | <p>Describes what After Effects needs rendered (in the PF_RenderRequest), and the bit depth requested (in the aptly-named bitdepth member).</p> <pre>typedef struct {     PF_LRect      rect;     PF_Field      field;     PF_ChannelMask channel_mask;     PF_Boolean    preserve_rgb_of_zero_ ↪alpha;     char          unused[3];     long          reserved[4]; } PF_RenderRequest;</pre> <p>rect is in layer coordinates. field is also relative to the layer origin; whether the active field falls on even or odd scanlines of the output buffer depends on the origin of the output buffer.</p> <p>channel_mask specifies for which channels the effect should provide output.</p> <p>Data written to other channels will not be honored.</p> <p>It will be one or more of the following, or'd together:</p> <ul style="list-style-type: none"> <li>• PF_ChannelMask_ALPHA</li> <li>• PF_ChannelMask_RED</li> <li>• PF_ChannelMask_GREEN</li> <li>• PF_ChannelMask_BLUE</li> <li>• PF_ChannelMask_ARGB</li> </ul> <p>If preserve_rgb_of_zero_alpha pixels is TRUE, the effect must propagate the color content of transparent pixels through to the output.</p> <p>This is related to, but distinct from, <a href="#">PF_OutFlag2_REVEALS_ZERO_ALPHA</a>, which tells After Effects that the effect may set alpha to non-zero values for such pixels, restoring them to visibility.</p> |
| PF_PreRenderOutput    | <p>Filled in by the effect to tell After Effects what output it plans to generate, based on the input.</p> <pre>typedef struct {     PF_LRect      result_ ↪rect;     PF_LRect      max_result_ ↪rect;     PF_Boolean    solid;     PF_Boolean    reserved;     PF_RenderOutputFlags flags;     void*         pre_render_ ↪data;     PF_DeletePreRenderDataFunc func; } PF_PreRenderOutput;</pre> <p>pre_render_data will be passed back to the effect during <a href="#">PF_Cmd_SMART_RENDER</a>.</p> <p>Currently, the only PF_RenderOutputFlags is PF_RenderOutputFlag_RETURNS_EXTRA_PIXELS.</p>   |
| PF_PreRenderCallbacks | <p>Currently, there is only one callback - checkout_layer. <a href="#">Chapter 46: SmartFX</a></p> <p>It must be positive and unique. After Effects populates the PF_CheckoutResult.</p>  |

## 46.7 preserve\_rgb\_of\_zero\_alpha

`preserve_rgb_of_zero_alpha` is used both as input to the effect, to tell it what to render, and as output from the effect, to describe the input it needs (as passed to the checkout call). When `preserve_rgb_of_zero_alpha` is set in an input request, the effect must pass it recursively when making checkouts, otherwise prior effects and masking will eliminate those pixels that the effect would reveal. Use of this is discouraged, though still supported in CS3 (8.0).

---

## 46.8 Rectangles

Effects must set both result rectangles accurately. After Effects' caching system relies upon them, incorrect values can cause many problems. If the plug-in returns a `result_rect` smaller than the `request_rect`, that tells After Effects the pixels inside the `request_rect` but outside the `result_rect` are empty.

Similarly, `max_result_rect` must encompass all non-zero pixels; the effect will never be asked to render anything outside this region. If there are pixels outside this rectangle, they will never be displayed.

Mis-sized output rectangles can cause problems as well. If these rectangles are too big, a loss of performance results.

Not only will many empty pixels be cached (robbing the application of valuable memory), the effect may be unnecessarily asked to render large regions of nothing. For this reason, the `max_result_rect` must be computed correctly, rather than set to some arbitrarily large size.

Both `result_rect` and `max_result_rect` may vary depending on the effect's parameters, the current time, et cetera; they are valid only for the given invocation of the effect. However, `max_result_rect` *cannot* depend on the specific render request. It must be the same no matter what portion of the output is requested by After Effects.

It is legal to return an empty `result_rect` if the `request_rect` doesn't intersect the effect's output pixels; no rendering need be done.

After Effects may also call the effect with an empty `request_rect`, meaning the effect is only being asked to compute the `max_result_rect`.

`preserve_rgb_of_zero_alpha` can influence the bounds computation process (both `result_rect` and `max_result_rect`) and must be respected if the effect behaves differently depending on this setting.

---

## 46.9 The "Size" Of A Layer

As with non-smart effects, each smart effect can arbitrarily shrink or expand its requested input. They cannot depend on a fixed frame size, and the size of the input may change over time.

For example, the user could apply an animated drop shadow to a layer, which would add pixels to different edges of the layer at different times, depending on the direction in which the shadow is cast.

Some effects (for example, those which need to align one layer against another) need some notion of "size." This could be defined two ways, each with advantages and disadvantages.

The size of the original layer, before any effects and downsampling are applied, is given `in_data>width/height`. As this value is unaffected by subsequent effects, it can act an absolute reference for things like center points.

However, this is not fool-proof, as the user could have applied a distortion or translation effect. Also, this value is available only for the layer to which the effect is applied, not other layer parameters.

... or ...

Every layer input has a `max_result_rect` which encompasses all pixel data, in some sense the master “size” of a layer.

It is available for all layers, but changes over time according to previously applied effects, possibly in ways the user might not expect (as in the drop shadow example above).

Note that the `ref_width/height` and `max_result_rect` for an input may be obtained without rendering, by calling `checkout_layer` with an empty `request_rect`.

This is fairly efficient, and can be useful if the layer “size” is needed first to determine exactly which pixels are required for rendering.

This is an example of requesting a layer in pre-render and then never calling `checkout_layer` (in this case, there are none).

---

## 46.10 Flag On The Play

Normally, the `max_result_rect` of a given `PF_RenderRequest` will be cropped to the bounds of any applied mask.

However, if `PF_OutFlag2_REVEALS_ZERO_ALPHA` is set, the `max_result_rect` will be the size of the layer.

---

## 46.11 PF\_Cmd\_SMART\_RENDER

The effect will receive at most one `PF_Cmd_SMART_RENDER` call for each pre-render.

Note that render may never be called at all. After Effects may have only wanted to perform some bounds computations, or it may have subsequently discovered that an effect’s output is not needed at all (which can happen, for example, if the pre-render phase for a track matte returns a rectangle that does not intersect the effect’s output.)

All effects must be able to handle Pre-Render without Render without leaking resources or otherwise entering an unstable state.

During `PF_Cmd_SMART_RENDER`, the extra parameter points to a `PF_SmartRenderExtra`.

---

## 46.12 PF\_SmartRenderExtra

| Member                  | Purpose   |
|-------------------------|---|
| PF_SmartRenderInput     | <p>Consists of a <i>PF_RenderRequest</i>, the bitdepth, and a pointer to <i>pre_render_data</i> (allocated during <i>PF_Cmd_SMART_PRE_RENDER</i>).</p> <p>This <i>PF_SmartRenderInput</i> is identical to that passed in the corresponding <i>PF_Cmd_SMART_PRE_RENDER</i>.</p>  |
| PF_SmartRenderCallbacks | <pre>PF_Err checkout_layer_pixels(     PF_ProgPtr    effect_ref,     A_long        checkout_idL,     PF_EffectWorld **pixels);</pre> <p>This is used to actually access the pixels in layers checked out during <i>PF_Cmd_SMART_PRE_RENDER</i>. The returned <i>PF_EffectWorld</i> is valid for duration of current command or until checked in.</p> <p>You are only allowed to call <i>checkout_layer_pixels</i> only once with the <i>checkout_idL</i> used earlier in <i>PF_Cmd_SMART_PRERENDER</i>. There must be a one-to-one mapping between the number of checkouts made in <i>PF_Cmd_SMART_PRERENDER</i> and <i>PF_Cmd_SMART_RENDER</i>.</p> <p>To call <i>checkout_layer_pixels</i> more than once on a layer, you should call <i>checkout_layer</i> on the same layer again with a different unique <i>checkout_idL</i> in <i>PF_Cmd_SMART_PRERENDER</i> and then use that <i>checkout_idL</i> to do another <i>checkout_layer_pixels</i> in <i>PF_Cmd_SMART_RENDER</i>.</p> <pre>PF_Err checkin_layer_pixels(     PF_ProgPtr    effect_ref,     A_long        checkout_idL);</pre> <p>It isn't necessary to call (After Effects cleans up all such checkouts when the effect returns from <i>PF_Cmd_SMART_RENDER</i>), but useful to free up memory.</p> <pre>PF_Err checkout_output(     PF_ProgPtr    effect_ref,     PF_EffectWorld **output);</pre> <p>Retrieves the output buffer. Note that effects are not allowed to check out output until at least one input has been checked out (unless the effect has no inputs at all). NOTE: For optimal memory usage, request the output as late as possible, and request inputs as few at a time as possible.</p> |

## 46.13 When To Access Layer Parameters

Parameters other than layer inputs may be freely checked out at any point. Layer inputs must be accessed during:ref:PF\_Cmd\_SMART\_PRE\_RENDER <effect-basics/command-selectors.frame-selectors>.

However, you aren't required to actually *use* every input.

If you check out a frame (or portion thereof) in *PF\_Cmd\_SMART\_PRE\_RENDER* and do not subsequently check it out in *PF\_Cmd\_SMART\_RENDER*, it need never be rendered, greatly improving performance.

---

## 46.14 Wait, Gimme That Layer Back!

`checkout_layer_pixels` can only be called once with the `checkout_id` used earlier in PreRender. There has to be a one-to-one mapping on the number of checkouts made in PreRender and SmartRender. If you need to check out the pixels of a layer more than once, perhaps because of the structure of your code, just use more than one `checkout_id`. In PreRender, call `checkout_layer` on the same layer with different unique `checkout_ids`. Then in SmartRender, use a different one of those `checkout_ids` each time `checkout_layer_pixels` is called in SmartRender.

---

## Effect UI & Events

---

Effects can provide custom UI in two areas: (1) the Effect Controls Window (custom ECW UI), and (2) the Composition or Layer Windows (Custom Comp UI).

Effects that use custom UI should set `PF_OutFlag_CUSTOM_UI` (from *PF\_OutFlags* during `PF_Cmd_GLOBAL_SETUP` (from *Global Selectors*), and handle the `PF_Cmd_EVENT` selector.

Custom ECW UI allows an effect to provide a parameter with a customized control, which can be used either with standard parameter types or *Arbitrary Data Parameters*.

Parameters that have a custom UI should set `PF_PUI_CONTROL` (from *Parameter UI Flags*) when *adding the parameter*.

Custom Comp UI allows an effect to provide direct manipulation of the video in the Composition or Layer Windows.

When the effect is selected, the Window can overlay custom controls directly on the video, and can handle user interaction with those controls, to adjust parameters more quickly and naturally.

Effects should register themselves to receive events by calling `PF_REGISTER_UI`.

After Effects can send events to effects for user interface handling and parameter management, integrating effects into its central message queue.

While many events are sent in response to user input, After Effects also sends events to effects which manage arbitrary data parameters.

The type of event is specified in *PF\_EventExtra->e\_type* and the various events are described below.

---

## 47.1 Events

| Event  | Indicates   |
|--|---|
| PF_Event_TheUserCreated                      | The user created a new context (probably by opening a window) for events.<br>The plug-in is allowed to store state information inside the context using the context handle.<br><i>PF_EventUnion</i> contains valid context and type, but everything else should be ignored.   |
| PF_Event_TheUserActivated                    | The user activated a new context (probably by bringing a window into the foreground).<br><i>PF_EventUnion</i> is empty.   |
| PF_Event_TheUserClicked                      | The user clicked within the effect's UI. <i>PF_EventUnion</i> contains a PF_DoClickEventInfo.<br>Handle the mouse click and respond, passing along drag info; see sample code), within a context.<br>NOTE: As of 7.0, do <i>not</i> block until mouse-up; instead, rely on PF_Event_DRAG.   |
| PF_Event_AClickEvent                         | A Click Event, <i>PF_EventUnion</i> contains a PF_DoClickEventInfo.<br>Request this by returning <code>send_drag == TRUE</code> from PF_Event_DO_CLICK.<br>Do this so After Effects can see new data from the user's changes.   |
| PF_Event_Draw                                | <i>PF_EventUnion</i> contains a PF_DrawEventInfo.   |
| PF_Event_TheUserDeactivated                  | The user has deactivated a context (probably by bringing another window into the foreground).<br><i>PF_EventUnion</i> is empty.   |
| PF_Event_AContextHasBeenClosed               | A context has been closed by the user. <i>PF_EventUnion</i> will be empty.  |
| PF_Event_AContextIsOpenButNothingIsHappening | A context is open but nothing is happening. <i>PF_EventUnion</i> is empty.  |
| PF_Event_TheMouseIsOver                      | The mouse is over the plug-in's UI. Set the cursor by changing the PF_CursorType in the PF_AdjustCursorEventInfo.<br>Use OS-specific calls to implement a custom cursor; tell After Effects you've done so by setting PF_CursorType to PF_Cursor_CUSTOM.<br>Use an After Effects cursor whenever possible to preserve interface continuity. |
| PF_Event_KeyStroke                           | <i>PF_EventUnion</i> contains a PF_KeyDownEvent.  |
| PF_Event_MouseClickNotification              | Notification that the mouse is no longer over a specific view (layer or comp only).   |

## CHAPTER 48

---

### PF\_EventExtra

---

This structure provide context information for the current event. After Effects passes a pointer to this structure in the extra parameter of the *Entry Point* function.

The PF\_EventUnion (sent in the PF\_EventExtra) varies with the event type, and contains information specific to that event.

| Member        | Purpose  |
|---------------|--|
| contextH      | Handle to the PF_Context.<br>This drawing context is used with the <i>Drawbot suites</i> for drawing, and also for the <i>UI Callbacks</i> .   |
| e_type        | Which <i>event</i> is occurring.   |
| u             | A <i>PF_EventUnion</i> containing information specific to the event.   |
| effect_win    | A PF_EffectWindowInfo about the event if it occurs within the effects window.<br>Otherwise, as of After Effects 5.0, effect_win can be replaced by a PF_WindowUnion.<br>This struct contains both a PF_EffectWindowInfo and an PF_ItemWindowInfo, which (for now) is simply the port rectangle for the item window.<br>Replacement only occurs if PF_USE_NEW_WINDOW_UNION was defined during compilation; otherwise, it will continue to be just a PF_EffectWindowInfo.  |
| cbs           | Pointer to <i>UI Callbacks</i> , which are needed to translate points between layer, composition, and screen coordinate systems.   |
| evt_in_flags  | Event Input Flags. This currently contains only one value, PF_EI_DONT_DRAW, which you should check before drawing!   |
| evt_out_flags | One or more of the following, combined with a bitwise OR operation: <ul style="list-style-type: none"> <li>• PF_EO_NONE</li> <li>• PF_EO_HANDLED_EVENT tells After Effects you've handled the event.</li> <li>• PF_EO_ALWAYS_UPDATE forces After Effects to rerender the composite in response to every click or drag; this is the same behavior generated by 'alt-scrubbing' the parameter value.</li> <li>• PF_EO_NEVER_UPDATE prevents After Effects from rerendering the composite until the user stops clicking and dragging.</li> <li>• PF_EO_UPDATE_NOW tells After Effects to update the view immediately after the event returns after calling PF_InvalidateRect</li> </ul> |

## 48.1 PF\_Context

PF\_Context details the event's UI context.

| Member           | Purpose  |
|------------------|--|
| magic            | Do not change.   |
| w_type           | The window type. If you have Custom Comp and ECW UIs in the same plug-in, this is the way to differentiate between them (what kind of masochist are you, anyway?). <ul style="list-style-type: none"> <li>• PF_Window_COMP,</li> <li>• PF_Window_LAYER,</li> <li>• PF_Window_EFFECT</li> </ul> |
| reserved_flt     | Do not change.   |
| plugin_state[4]  | An array of 4 A_longs which the plug-in can use to store state information for a given context.  |
| reserved_drawref | A DRAWBOT_DrawRef for use with the <i>Drawbot suites</i> .   |
| *reserved_paneP  | Do not change.   |

## 48.2 PF\_EffectWindowInfo

If an event occurs in the ECP, an PF\_EffectWindowInfo is sent in PF\_EventExtra.

| Member        | Purpose   |
|---------------|---|
| index         | This indicates which parameter in the effect window is being affected. The controls are numbered from 0 to the number of controls minus 1.  |
| area          | This indicates if the control title (PF_EA_PARAM_TITLE) or the control itself (PF_EA_CONTROL) are being affected. The title is the area still visible when the parameter's topic ("twirly") is spun up. |
| current_frame | A PF_Rect indicating the full frame of the area occupied by the control.  |
| param_title   | A PF_Rect indicating the title area of the control.   |
| horiz_offset  | A horizontal offset from the left side of the title area in which to draw into the title.   |

The PF\_EventUnion in PF\_EventExtra is a union of the four following structures.

## 49.1 Click

A mouse click or drag occurred within the custom UI's area.

### 49.1.1 PF\_DoClickEventInfo

| Member        | Purpose  |
|---------------|--|
| when          | The (OS-level) time at which the click occurred.   |
| screen_point  | Where, in screen coordinates, the click occurred. For Custom Comp UI, these coordinates can be converted to composition coordinates using the <i>UI Callbacks</i> . See the CCU sample project for an example. |
| num_clicks    | The number of clicks that occurred.  |
| modifiers     | Which modifier keys (if any) were held down during click.  |
| continue_drag | An array of 4 A_intptr_t the plug-in can use to store information during a click-drag-drag sequence.   |
| send_drag     | Set this flag to TRUE to indicate continued dragging. The next click event will then effectively be a drag event.  |
| last_time     | Set when the drag event ends (the user has released the mouse button).   |

## 49.2 Draw

After Effects needs your custom UI to refresh.

Note: when handling draw requests, use the image dimensions provided in *PF\_InData* (rather than the dimensions of your input layer, as you would during *PF\_Cmd\_RENDER*).

### 49.2.1 PF\_DrawEventInfo

| Member | Purpose  |
|--------|--|
| update | The rectangle in which to draw, in the context window's coordinate system. These coordinates can be converted to different coordinate systems using the <i>UI Callbacks</i> . See the CCU sample project for an example. |
| depth  | Pixel depth of the drawing context.  |

---

## 49.3 Keydown

The user pressed a key, and the effect's UI is active.

Use the macros in *AE\_EffectUI.h* to access and manipulate the key codes received.

In order to receive keydown events in Premiere Pro, plug-ins must set *PF\_CustomEFlag\_COMP* in *PF\_CustomUIInfo.events* during .. *\_PF\_Cmd\_PARAM\_SETUP*. *PF\_KeyDownEvent*  
 \*\*\*\*\*

| Member       | Purpose   |
|--------------|---|
| when         | Time at which the click occurred.   |
| screen_point | Screen coordinate of the mouse pointer when the key was pressed. For Custom Comp UI, these coordinates can be converted to composition coordinates using the <i>UI Callbacks</i> . See the CCU sample project for an example.   |
| key_code     | <p>Either a character code (for printable characters, we use the unshifted upper case version; A not a, 7 not &amp;), or a control code:</p> <ul style="list-style-type: none"> <li>• PF_ControlCode_Unknown</li> <li>• PF_ControlCode_Space</li> <li>• PF_ControlCode_Backspace</li> <li>• PF_ControlCode_Tab</li> <li>• PF_ControlCode_Return</li> <li>• PF_ControlCode_Enter</li> <li>• PF_ControlCode_Escape</li> <li>• PF_ControlCode_F1</li> <li>...</li> <li>• PF_ControlCode_F24</li> <li>• PF_ControlCode_PrintScreen</li> <li>• PF_ControlCode_ScrollLock</li> <li>• PF_ControlCode_Pause</li> <li>• PF_ControlCode_Insert</li> <li>• PF_ControlCode_Delete</li> <li>• PF_ControlCode_Home</li> <li>• PF_ControlCode_End</li> <li>• PF_ControlCode_PageUp</li> <li>• PF_ControlCode_PageDown</li> <li>• PF_ControlCode_Help</li> <li>• PF_ControlCode_Clear</li> <li>• PF_ControlCode_Left</li> <li>• PF_ControlCode_Right</li> <li>• PF_ControlCode_Up</li> <li>• PF_ControlCode_Down</li> <li>• PF_ControlCode_NumLock</li> <li>• PF_ControlCode_Command</li> <li>• PF_ControlCode_Option</li> <li>• PF_ControlCode_Alt = PF_ControlCode_Option</li> <li>• PF_ControlCode_Control</li> <li>• PF_ControlCode_Shift</li> <li>• PF_ControlCode_CapsLock</li> <li>• PF_ControlCode_ContextMenu</li> </ul> |
| modifiers    | <p>Which (if any) modifier keys were down during the key press.</p> <ul style="list-style-type: none"> <li>• PF_Mod_NONE</li> <li>• PF_Mod_CMD_CTRL_KEY (cmd on Mac, ctrl on Windows)</li> <li>• PF_Mod_SHIFT_KEY</li> <li>• PF_Mod_CAPS_LOCK_KEY</li> <li>• PF_Mod_OPT_ALT_KEY (option on Mac, alt on Windows)</li> <li>• PF_Mod_MAC_CONTROL_KEY</li> </ul>  |

## 49.4 AdjustCursor

The cursor has moved onto (but not off of) the effect's custom UI, to allow the effect to change the cursor.

### 49.4.1 PF\_AdjustCursorEventInfo

| Member     | Purpose  |
|------------|--|
| screen_x   | Screen coordinate of the mouse pointer. For Custom Comp UI, these coordinates can be converted to composition coordinates using the <i>UI Callbacks</i> . See the CCU sample project for an example.   |
| modifier   | What, if any, modifier keys were held down when the message was sent.  |
| set_cursor | Set this to your desired cursor, or PF_Cursor_CUSTOM if you have set the cursor yourself using OS-specific calls. See AE_EffectUI.h for a complete enumeration of built-in cursors. If you don't want to override the cursor, set this to PF_Cursor_NONE, or simply ignore this message. |

## 49.5 Arbitrary Parameters Event

After Effects needs your plug-in to manage its arbitrary data parameter(s).

Though arbitrary data types are not required for custom UI support, PF\_ArbParamsExtra follows the EventInfo model.

### 49.5.1 PF\_ArbParamsExtra

| Member   | Purpose   |
|--|---|
| which_function   | A PF_FunctionSelector indicating which function is called   |
| id   | Used by After Effects; will match the ID assigned to the arbitrary data type during <i>PF_Cmd_PARAM_SETUP</i> . |
| padding  | Used for byte-alignment   |
| <pre> u {   new_func_params   dispose_func_params   copy_func_params   flat_size_func_params   flatten_func_params   unflatten_func_params   interp_func_params   compare_func_params   print_size_func_params   print_func_params   scan_func_params } </pre> | (One of these will be passed; see <i>Arbitrary Data Parameters</i> )  |

Custom UI uses a composited drawing model using Drawbot. The Drawbot suites can be used for:

1. Basic 2D path drawing: Lines, Rect, Arc, Bezier
2. Stroking/Filling/Shading paths
3. Image drawing: Compositing an ARGB/BGRA buffer onto the surface
4. Pushing/popping surface state
5. Text drawing, if supplier supports it (clients should first check if text drawing is supported before actual drawing)

Drawing may only occur during `PF_Event_DRAW` (and not during `PF_Event_DRAG` or `PF_Event_DO_CLICK`).

To use Drawbot, first get the drawing reference by passing in `PF_Context` to a new suite call *`PF_GetDrawingReference`*.

If a non-NULL drawing reference is returned, use it to get the supplier and surface references from *`DRAWBOT_DrawbotSuite`*.

The Drawbot suites include `DRAWBOT_DrawbotSuite`, `DRAWBOT_SupplierSuite`, `DRAWBOT_SurfaceSuite`, `DRAWBOT_PathSuite`.

---

## 50.1 Make Your Custom UI Look Not So “Custom”

Use the new *`PF_EffectCustomUIOverlayThemeSuite`* to match the host application UI. Your users will thank you.

---

## 50.2 Redrawing

In order to redraw a specific area of a pane, we recommend the following:

- 1) Call `PF_InvalidateRect` (from *PF\_AppSuite*) from the effect. This will cause a lazy display redraw, and will update at the next available idle moment. This rect is in coordinates related to the associated pane. Using a NULL rect will update the entire pane.
- 2) Set the *event outflag* to `PF_EO_UPDATE_NOW`, which will cause an immediate draw event for the specified pane when the current event returns.

If an effect needs to update more than one window at a time, it should set `PF_OutFlag_REFRESH_UI` (from *PF\_OutFlags*), which will cause a redraw of the entire ECW, comp, and layer windows.

---

## 50.3 HiDPI and Retina Display Support

To support HiDPI and Retina Displays, you can use offscreen images that are twice the size, and then use the `Transform` function from *Drawbot\_SurfaceSuite* to scale the image down in half before drawing it.

---

## 50.4 PF\_EffectCustomUISuite

Enables an effect to get the drawing reference. This is the first call needed to use Drawbot.

### 50.4.1 PF\_EffectCustomUISuite1

| Function                            | Purpose   |
|-------------------------------------|---|
| <code>PF_GetDrawingReference</code> | Get the drawing reference.<br><pre>PF_GetDrawingReference(<br/>    const PF_ContextH  effect_contextH,<br/>    DRAWBOT_DrawRef   *referenceP0);</pre> |

---

## 50.5 Drawbot\_DrawbotSuite

Using the Drawbot reference, get the supplier and surface references.

### 50.5.1 Drawbot\_DrawbotSuite1

| Function    | Purpose  |
|-------------|--|
| GetSupplier | Get the supplier reference.<br>Needed to use <i>Drawbot_SupplierSuite</i> .<br><br><pre>GetSupplier(<br/>    DRAWBOT_DrawRef      in_drawbot_ref,<br/>    DRAWBOT_SupplierRef *out_supplierP);</pre> |
| GetSurface  | Get the surface reference.<br>Needed to use <i>Drawbot_SurfaceSuite</i> .<br><br><pre>GetSurface(<br/>    DRAWBOT_DrawRef      in_drawbot_ref,<br/>    DRAWBOT_SurfaceRef  *out_surfaceP);</pre>     |

### 50.6 Drawbot\_SupplierSuite

Calls to create and release drawing tools, get default settings, and query drawing capabilities.

## 50.6.1 Drawbot\_SupplierSuite1

| Function           | Purpose  |
|--------------------|--|
| NewPen             | <p>Create a new pen. Release this using ReleaseObject from <i>Drawbot_SupplierSuite</i>.</p> <pre>NewPen(     DRAWBOT_SupplierRef    in_supplier_     ↪ref,     const DRAWBOT_ColorRGBA *in_colorP,     float                    in_size,     DRAWBOT_PenRef         *out_penP);</pre>   |
| NewBrush           | <p>Create a new brush. Release this using ReleaseObject from <i>Drawbot_SupplierSuite</i>.</p> <pre>NewBrush(     DRAWBOT_SupplierRef    in_supplier_     ↪ref,     const DRAWBOT_ColorRGBA *in_colorP,     DRAWBOT_BrushRef       *out_brushP);</pre>   |
| SupportsText       | <p>Check if current supplier supports text.</p> <pre>SupportsText(     DRAWBOT_SupplierRef    in_supplier_ref,     DRAWBOT_Boolean        *out_supports_     ↪textB);</pre>  |
| GetDefaultFontSize | <p>Get the default font size.</p> <pre>GetDefaultFontSize(     DRAWBOT_SupplierRef    in_supplier_ref,     float                  *out_font_sizeF);</pre>  |
| NewDefaultFont     | <p>Create a new font with default settings. You can pass the default font size from GetDefaultFontSize. Release this using ReleaseObject from <i>Drawbot_SupplierSuite</i>.</p> <pre>NewDefaultFont(     DRAWBOT_SupplierRef    in_supplier_ref,     float                  in_font_sizeF,     DRAWBOT_FontRef        *out_fontP);</pre>   |
| NewImageFromBuffer | <p>Create a new image from buffer passed to in_dataP. Release this using ReleaseObject from <i>Drawbot_SupplierSuite</i>.</p> <pre>NewImageFromBuffer(     DRAWBOT_SupplierRef    in_supplier_ref,     int                    in_width,     int                    in_height,     int                    in_row_bytes,     DRAWBOT_PixelLayout    in_pl,     const void             *in_dataP,     DRAWBOT_ImageRef       *out_imageP);</pre> <p>DRAWBOT_PixelLayout can be one of the following:</p> <ul style="list-style-type: none"> <li>• kDRAWBOT_PixelLayout_24RGB,</li> <li>• kDRAWBOT_PixelLayout_24BGR,</li> </ul> |

## 50.6. Drawbot\_SupplierSuite

- kDRAWBOT\_PixelLayout\_32RGB,
- ARGB (A is ignored),
- kDRAWBOT\_PixelLayout\_32BGR,
- BGRA (A is ignored),
- kDRAWBOT\_PixelLayout\_32ARGB Straight.

## 50.7 Drawbot\_SurfaceSuite

Calls to draw on the surface, and to query and set drawing settings.

## 50.7.1 Drawbot\_SurfaceSuite1

| Function           | Purpose  |
|--------------------|--|
| PushStateStack     | <p>Push the current surface state onto the stack. It should be popped to retrieve old state. It is required to restore state if you are going to clip or transform a surface or change the interpolation or anti-aliasing policy.</p> <pre>PushStateStack (     DRAWBOT_SurfaceRef  in_surface_ref);</pre>   |
| PopStateStack      | <p>Pop the last pushed surface state off the stack.</p> <pre>PopStateStack (     DRAWBOT_SurfaceRef  in_surface_ref);</pre>  |
| PaintRect          | <p>Paint a rectangle with a color on the surface.</p> <pre>PaintRect (     DRAWBOT_SurfaceRef      in_surface_     ↪ref,     const DRAWBOT_ColorRGBA *in_colorP,     const DRAWBOT_RectF32   *in_rectPR);</pre>  |
| FillPath           | <p>Fill a path using a brush and fill type.</p> <pre>FillPath (     DRAWBOT_SurfaceRef  in_surface_ref,     DRAWBOT_BrushRef    in_brush_ref,     DRAWBOT_PathRef     in_path_ref,     DRAWBOT_FillType    in_fill_type);</pre> <p>DRAWBOT_FillType is one of the following:</p> <ul style="list-style-type: none"> <li>• kDRAWBOT_FillType_EvenOdd,</li> <li>• kDRAWBOT_FillType_Winding</li> </ul> |
| StrokePath         | <p>Stroke a path using a pen.</p> <pre>StrokePath (     DRAWBOT_SurfaceRef  in_surface_ref,     DRAWBOT_PenRef      in_pen_ref,     DRAWBOT_PathRef     in_path_ref);</pre>  |
| Clip               | <p>Clip the surface.</p> <pre>Clip (     DRAWBOT_SurfaceRef      in_surface_ref,     DRAWBOT_SupplierRef     in_supplier_ref,     const DRAWBOT_Rect32    *in_rectPR);</pre>   |
| GetClipBounds      | <p>Get clip bounds.</p> <pre>GetClipBounds (     DRAWBOT_SurfaceRef  in_surface_ref,     DRAWBOT_Rect32      *out_rectPR);</pre>   |
| IsWithinClipBounds | <p>Checks whether a rect is within the clip bounds.</p> <pre>IsWithinClipBounds (     DRAWBOT_SurfaceRef      in_surface_ref,     const DRAWBOT_Rect32    *in_rectPR,     DRAWBOT_Boolean         *out_withinPB);</pre>  |
| Transform          | <p>Transform the last surface state.</p> <pre>Transform (     DRAWBOT_SurfaceRef  in_surface_     ↪ref,     const DRAWBOT_MatrixF32 *in_matrixP);</pre>  |
| 188                | <p><b>Chapter 50. Custom UI &amp; Drawbot</b></p>  |
| DrawString         | <p>Draw a string</p>   |

## 50.8 Drawbot\_PathSuite

Calls to draw paths.

### 50.8.1 Drawbot\_PathSuite1

| Function | Purpose  |
|----------|--|
| MoveTo   | Move to a point.<br><pre>MoveTo (   DRAWBOT_PathRef  in_path_ref,   float             in_x,   float             in_y);</pre>   |
| LineTo   | Add a line to the path.<br><pre>LineTo (   DRAWBOT_PathRef  in_path_ref,   float             in_x,   float             in_y);</pre>  |
| BezierTo | Add a cubic bezier to the path.<br><pre>BezierTo (   DRAWBOT_PathRef      in_path_ref,   const DRAWBOT_PointF32 *in_pt1P,   const DRAWBOT_PointF32 *in_pt2P,   const DRAWBOT_PointF32 *in_pt3P);</pre>   |
| AddRect  | Add a rect to the path.<br><pre>AddRect (   DRAWBOT_PathRef      in_path_ref,   const DRAWBOT_RectF32 *in_rectPR);</pre>   |
| AddArc   | Add a arc to the path. Zero start degrees == 3 o'clock. Sweep is clockwise. Units for angle are in degrees.<br><pre>AddArc (   DRAWBOT_PathRef      in_path_ref,   const DRAWBOT_PointF32 *in_centerP,   float                 in_radius,   float                 in_start_angle,   float                 in_sweep);</pre> |
| Close    | Close the path.<br><pre>Close (   DRAWBOT_PathRef  in_path_ref);</pre>   |

## 50.9 PF\_EffectCustomUIOverlayThemeSuite

This suite should be used for stroking and filling paths and vertices on the Composition and Layer Windows. After Effects is using this suite internally, and we have made it available to make custom UI look consistent across effects. The foreground/shadow colors are computed based on the app brightness level so that custom UI is always visible regardless of the application's Brightness setting in the Preferences.

## 50.9.1 PF\_EffectCustomUIOverlayThemeSuite1

| Function                       | Purpose  |
|--------------------------------|--|
| PF_GetPreferredForegroundColor | Get the preferred foreground color.<br><br>PF_GetPreferredForegroundColor(<br>DRAWBOT_ColorRGBA *foreground_colorP);   |
| PF_GetPreferredShadowColor     | Get the preferred shadow color.<br><br>PF_GetPreferredShadowColor(<br>DRAWBOT_ColorRGBA *shadow_colorP);   |
| PF_GetPreferredStrokeWidth     | Get the preferred foreground & shadow stroke width.<br><br>PF_GetPreferredStrokeWidth(<br><b>float</b> *stroke_widthPF);   |
| PF_GetPreferredVertexSize      | Get the preferred vertex size.<br><br>PF_GetPreferredVertexSize(<br><b>float</b> *vertex_sizePF);  |
| PF_GetPreferredShadowOffset    | Get the preferred shadow offset.<br><br>PF_GetPreferredShadowOffset(<br>A_LPoint *shadow_offsetP);   |
| PF_StrokePath                  | Stroke the path with the overlay theme foreground color. Optionally draw the shadow using the overlay theme shadow color. Uses overlay theme stroke width for stroking foreground and shadow strokes.<br><br>PF_StrokePath(<br><b>const</b> DRAWBOT_DrawRef drawbot_ref,<br><b>const</b> DRAWBOT_PathRef path_ref<br>PF_Boolean draw_shadowB); |
| PF_FillPath                    | Fills the path with overlay theme foreground color. Optionally draw the shadow using the overlay theme shadow color.<br><br>PF_FillPath(<br><b>const</b> DRAWBOT_DrawRef drawbot_ref,<br><b>const</b> DRAWBOT_PathRef path_ref<br>PF_Boolean draw_shadowB);  |
| PF_FillVertex                  | Fills a square vertex around the center point using the overlay theme foreground color and vertex size.<br><br>PF_FillVertex(<br><b>const</b> DRAWBOT_DrawRef drawbot_ref,<br><b>const</b> A_FloatPoint *center_pointP<br>PF_Boolean draw_shadowB);  |

---

## UI Callbacks

---

After Effects provides callbacks for transposing between coordinate systems, and obtaining OS-specific information about drawing contexts, without guesswork or asking the OS directly. Use these callbacks! Pointers to these callbacks are provided in `PF_EventCallbacks`. Use the macros in `AE_EffectUI.h` and `AE_EffectCB.h` to access these routines.

It is possible to build a functioning plug-in which utilizes a custom UI without implementing the coordinate system transposition callbacks. However, the moment a user zooms into the layer panel or rotates a layer, your plug-in will behave badly. We added these macros and callbacks so that custom user interfaces could be easily integrated into the After Effects UI, without inflicting user interface overhead on developers. Again, please use them!

These macros default the `refcon` and `context` handle for simplicity. The `refcon` assumes you have a local variable named “extra”. The default context is the current context. These default parameters are defined in the `PF_EventCallbacks` structure (in `AE_EffectUI.h`). You can override the defaults by accessing the callbacks through the `PF_EventExtra` structure. We don’t recommend (or support) modification of the macros in the header file. Don’t do it!

| Function             | Purpose  |
|----------------------|--|
| layer_to_comp        | <p>Transforms layer panel coordinates to the composition panel coordinates.</p> <pre>PF_Err layer_to_comp (     void          *refcon,     PF_ContextH   context,     A_long        curr_time,     A_long        time_scale,     PF_FixedPoint *pt);</pre>   |
| comp_to_layer        | <p>Transforms composition panel coordinates to the layer panel coordinates.</p> <pre>PF_Err comp_to_layer (     void          *refcon,     PF_ContextH   context,     A_long        curr_time,     A_long        time_scale,     PF_FixedPoint *pt);</pre>   |
| get_comp2layer_xform | <p>Returns the matrix used to convert from the composition panel to the layer panel. If *exists returns FALSE, the matrix cannot be computed because the layer scales to zero.</p> <pre>PF_Err get_comp2layer_xform (     void          *refcon,     PF_ContextH   context,     A_long        curr_time,     long         time_scale,     long         *exists,     PF_FloatMatrix *comp2layer);</pre> |
| get_layer2comp_xform | <p>Returns the transformation matrix used to convert from the layer panel to the composition panel. This always exists.</p> <pre>PF_Err get_layer2comp_xform (     void          *refcon,     PF_ContextH   context,     A_long        curr_time,     A_long        time_scale,     PF_FloatMatrix *layer2comp);</pre>   |
| source_to_frame      | <p>Transforms the source coordinates in the current context to screen coordinates. Screen (frame) coordinates are affected by the current zoom level.</p> <pre>PF_Err source_to_frame(     void          *refcon,     PF_ContextH   context,     PF_FixedPoint *pt);</pre>   |
| frame_to_source      | <p>Transforms the screen coordinates identified by *pt to the source coordinates of the current context.</p> <pre>PF_Err frame_to_source(     void          *refcon,     PF_ContextH   context,     PF_FixedPoint *pt);</pre>  |
| PF_GET_PLATFORM_DATA | <p>Retrieves platform-specific data. For plug-</p>   |
| 194                  | <p>ins loaded with localized resource files. <b>Chapter 51. UI Callbacks</b><br/>         PF_PlatformData_RES_FILE_PATH will point to the external file, not the plug-in file. Use PF_PlatformData_EXE_FILE_PATH if you want the path of your plug-in.</p>   |

### 52.1 UI Performance

Experiment with `PF_EO_ALWAYS_UPDATE` and `PF_EO_NEVER_UPDATE` from *PF\_EventExtra*, to find a happy medium between responsiveness and accuracy.

On macOS, the foreground and background colors are not set to white and black when custom UI draw events are sent. This is by design; you don't have to change the background color when you're drawing directly into our context.

---

### 52.2 How Deep Are My Pixels?

There is no way to determine the bit depth of the layer(s) being processed during events.

However, you can cache the last-known pixel depth in your sequence data.

Better still, you can have your fixed and float slider parameters rely on the `PF_ValueDisplayFlags` in their parameter definitions; if you use this, it will have your parameters' UI respond to the user's preferences for pixel display values.

You can also check the depth of your input world during `PF_Cmd_RENDER`.

---

### 52.3 Arbitrary Data

An arbitrary data parameter is an excellent way to manage your custom UI.

Store state, preference, and last-item-used information in an arb, and you'll always be able to recover it.

After Effects manages parameters with a much richer message stream than custom UIs.

---

## 52.4 Custom UI Implementation for Color Sampling, Using Keyframes

A plug-in may want to get a color from a layer within a composition. The user would use the eyedropper associated with a color parameter, or the plug-in's custom composition panel UI, to select the point.

During the click event, the plug-in converts the coordinates of the click into layer space, and stores that information in sequence data. It then forces a re-render, during which it has access to the color of the layer point corresponding to the stored coordinates.

The plug-in stores the color value in sequence data, and cancels the render, requesting a redraw of the affected parameter(s).

Finally, during the draw, the plug-in adds appropriate keyframes to its color parameter stream using the *AEGP\_KeyframeSuite*.

Yes, this means the effect needs to *Cheating Effect Usage of AEGP Suites* and use the AEGP API.

After Effects can process audio encoded at up to 96Khz, floating point (24-bit) resolution, mono or stereo.

We provide high quality resampling.

`PF_InData` and `PF_OutData` both contain information specific to audio handling.

While audio isn't the focus of After Effects' feature set, it is an important component of compositing and pre-visualization workflows.

Also, several engineers on our team are audio fanatics, and ensure that our audio effects (and the whole audio pipeline) are of the highest quality.

## CHAPTER 54

---

### Global Outflags

---

All audio effects must set either `PF_OutFlag_AUDIO_EFFECT_TOO` or `PF_OutFlag_AUDIO_EFFECT_ONLY`.

`PF_OutFlag_I_USE_AUDIO` is for visual effects that check out audio data, but don't modify it.

`PF_OutFlag_AUDIO_FLOAT_ONLY`, `PF_OutFlag_AUDIO_IIR` and `PF_OutFlag_I_SYNthesize_AUDIO` provide greater control over audio output (see *PF\_OutFlags* for more details).

---

## Audio Data Structures

---

The following data types are used by After Effects to describe audio data.

| Structure          | Description   |
|--------------------|---|
| PF_SoundFormat     | Indicates whether the audio is in unsigned pulse code modulation (PCM), signed PCM, or floating point format.   |
| PF_SoundSampleSize | Samples are in 1, 2, or 4 byte format.  |
| PF_SoundChannels   | Indicates whether the audio is mono or stereo.  |
| PF_SoundFormatInfo | Contains the sampling rate, number of channels, sample size, and format of the audio to which it refers.  |
| PF_SoundWorld      | Use PF_SoundWorlds to represent audio. In addition to a PF_SoundFormatInfo, they contain the length of the audio, and a pointer to the actual audio data. |

PF\_SoundFormat, PF\_SoundSampleSize, and PF\_SoundChannels are all contained within a PF\_SoundFormatInfo.

PF\_SoundWorlds contain a PF\_SoundFormatInfo, and further instance-specific information.

---

## Audio-Specific Float Slider Variables

---

PF\_Param\_FLOAT\_SLIDERS contain several parameters not found in other sliders; flags, phase, and curve tolerance.

---

### 56.1 Flags

The only flag available is PF\_FSliderFlag\_WANT\_PHASE.

This registers the effect to receive updated phase information from After Effects during audio rendering.

To understand what this flag does, turn it off and check your output.

---

### 56.2 Phase

This is where the requested phase value is stored.

---

### 56.3 Curve Tolerance

Curve tolerance is used by After Effects to subdivide the audio effects' time-variant parameters. Set this to zero for default behavior (or for non-audio FLOAT\_SLIDER parameters).

---

## 56.4 What's Zero, Really?

When amplitude is zero, After Effects is at -192db.

---

## Accessing Audio Data

---

Use `PF_CHECKOUT_LAYER_AUDIO` from *Interaction Callbacks* to retrieve an audio layer.

This layer is opaque; use `PF_GET_AUDIO_DATA` to access specific details about that audio.

As with pixel data, it's important that you check in the audio as soon as possible.

If your effect requires as input a time span different from the output time span, update the `startsampL` and `endsampL` field in `PF_OutData` during `PF_Cmd_AUDIO_SETUP` from *Frame Selectors*.

---

### 57.1 Extending Audio Clips

You cannot extend the length of an audio clip through the API.

However, it is a relatively simple matter for the user to extend the length of the clip before applying your effect. Apply time remapping to the layer and simply extend the out point.

If you're adding a delay effect to a sounds clip, you'd want to allow it time to fade away instead of truncating the sound at the original end point.

Document the steps users should take when applying your effect.

---

### Audio Considerations

---

The After Effects audio API supports sampling rates up to 96Khz, in as many formats as possible.

In the same way that plug-ins' pixel manipulation functions should remain "resolution independent", audio plug-ins should be sample rate- and bit depth-independent.

Your plug-in can't know anything about the final output format of the audio in question; it might get stretched, normalized, truncated, or phase-inverted between the application of your plug-in and the final output.

Audio filters encounter different issues than do image filters.

Investigate the SDK sample for one possible implementation of audio rendering.

The After Effects General Plug-in (AEGP) API is powerful and broad, offering functionality beyond what is available to effect plug-ins.

To users, AEGPs appear to be part of After Effects.

They can add, intercept, and trigger menu commands, access the keyframe database, and register functions as part of After Effects' internal messaging.

AEGPs can add and remove items to projects and compositions, add and remove filters and keyframes.

Once its command is triggered, AEGPs use the numerous PICA function suites (described in this section) to work with every After Effects item.

AEGPs can publish function suites for plug-ins, manipulate all project elements, change interpretations, replace files and determine which external files are used to render a project.

There are several specialized types of AEGP; Keyframers, Artisans, and I/O modules (AEIOs). They are all still AEGPs, but have access to specialized messaging streams, for which they register with After Effects.

For what's new in CC releases, see *What's New*.

---

### 60.1 What's New In CS6?

3D is a major theme of AE CS6. A new `AEGP_LayerFlag_ENVIRONMENT_LAYER` has been added. Many new *layer streams* were added.

Additionally, `AEGP_LayerStream_SPECULAR_COEFF` was renamed to `AEGP_LayerStream_SPECULAR_INTENSITY`, `AEGP_LayerStream_SHININESS_COEFF` was renamed to `AEGP_LayerStream_SPECULAR_SHININESS`, and `AEGP_LayerStream_METAL_COEFF` was renamed to just `AEGP_LayerStream_METAL`.

A new suite, *AEGP\_RenderQueueMonitorSuite1*, provides all the info a render queue manager needs to figure out what is happening at any point in a render.

*Mask Suite* is now at version 6, and provides functions to get and set the mask feather falloff type. *Mask Outline Suite* is now at version 3, and provides access to get and set mask outline feather information.

*Composition Suite* is now at version 9. `AEGP_CreateTextLayerInComp` and `AEGP_CreateBoxTextLayerInComp` now have a new parameter, `select_new_layerB`.

*Render Suite* is now at version 3, adding a new function to get the GUID for a render receipt.

Finally, we have added two new read-only *Dynamic Stream Suite* flags: `AEGP_DynStreamFlag_SHOWN_WHEN_EMPTY` and `AEGP_DynStreamFlag_SKIP_REVEAL_WHEN_UNHIDDEN`.

AEGPs use Plug-In Component Architecture (PICA) function suites to access all functionality.

They may also publish their own function suites, for use by effect plug-ins (since plug-in load order varies, AEGPs can't depend on suites not provided by After Effects).

AEGPs can also request a suite and, if it's not present, provide replacement functionality themselves.

---

## 61.1 AEGP Communication With After Effects

For effect plug-ins, all communication with After Effects occurs through a single entry point function. This is not the case with AEGPs.

While After Effects *does* call the entry point function designated in the AEGP's PiPL (which is still required), all subsequent communication between After Effects and AEGPs is handled by the hook functions the AEGP registers.

This registration must be performed from within the plug-in's entry function, using the *Register Suite*.

---

## 61.2 Different Tasks, Same API

AEGPs work in the same manner, regardless of specialization.

They can be simple, just *adding one menu item* to trigger an external application, or complex like Artisans.

While any plug-in can access any function suite, only plug-ins of the appropriate type will have access to all the required parameters.

Only Artisans will have render contexts, and only AEIO plug-ins will receive input and output specifications; messaging is dependent upon which hook functions are registered.

---

## CHAPTER 62

---

### Data Types

---

Whenever possible, After Effects presents plug-ins with opaque data types, and provides accessor functions for manipulating them. For example, video frames are represented using the opaque `AEGP_WorldH`. While in some cases it might be more efficient to simply modify the underlying structure, by maintaining the opaqueness of the data types we allow for changes to our implementation without making you recompile (and redistribute) your plug-ins.

---

## 62.1 AEGP API Data Types

| Type                       | Describes  | Manage Using  |
|----------------------------|--|---|
| AEGP_MemHandle             | This structure contains more than just the referenced memory. So it should not be dereferenced directly. Use AEGP_LockMemHandle in the AEGP Memory Suite to get a pointer to the memory referenced by the AEGP_MemHandle. And of course, unlock it when you're done.                 | <i>AEGP Memory Suite</i>  |
| AEGP_ProjectRef            | The current After Effects project. Projects are a set of elements arranged hierarchically in a tree to preserve semantic relationships. Interior nodes of the tree are folders. As of CS6, there will only ever be one open project.   | <i>AEGP Project Suite</i>   |
| AEGP_ItemRef               | An abstraction describing any element of a project, including folders. An item is anything that can be selected. Since multiple object types can be selected, we treat them as AEGP_ItemRefs until more specificity is required.   | <i>AEGP Item Suite</i>  |
| AEGP_CollectionRef         | A set of selected items.   | <i>AEGP Collection Suite</i>  |
| AEGP_CompositionRef        | A composition is a sequence of renderable items that, together, produce output. A composition exists over a time interval. Multiple compositions can exist within one project.   | <i>AEGP Composition Suite</i>   |
| AEGP_FootageRef            | Any item that can be rendered. Folders and compositions are the only items that are not footage.   | <i>AEGP Footage Suite</i>   |
| AEGP_LayerRef              | An element of a composition. Layers are rendered in sequence, which allows for occlusions. Solids, text, paint, cameras, lights, images, and image sequences are all represented as layers. Layers may be defined over sub-intervals of the composition's time interval.             | <i>AEGP Layer Suite</i>   |
| AEGP_WorldRef              | A frame of pixels.   | <i>AEGP World Suite</i>   |
| AEGP_EffectRef             | An effect applied to a layer. An effect is a function that takes as its argument a layer (and possibly other parameters) and returns an altered version of the layer for rendering.  | <i>AEGP Effect Suite</i>  |
| AEGP_StreamRef             | An <i>operator stream</i> attached to a layer, in a composition. See the description of AEGP_GetNewLayerStream from <i>AEGP_StreamSuite5</i> for a full list of stream types.  | <i>AEGP Stream Suite, AEGP Dynamic Stream Suite AEGP Keyframe Suite</i> |
| AEGP_MaskRef               | A mask applied to a layer. An AEGP_MaskRef is used to access details about the mask stream, not the specific points which constitute the mask. A mask is a rasterized path (sequence of vertices) that partitions a layer into two pieces, allowing each to be rendered differently. | <i>AEGP Mask Suite</i>  |
| AEGP_MaskOutlineRef        | The specific points which constitute the mask. The points in a mask outline are ordered, and the mask need not be closed.  | <i>AEGP Mask Outline Suite</i>  |
| AEGP_TextRef               | Represents the actual text associated with a text layer.   | <i>AEGP Text Document Suite</i>   |
| AEGP_TextPathRef           | References to all the paths that make up the outlines of a given text layer.   | <i>AEGP Text Layer Suite</i>  |
| AEGP_MarkerRef             | The data associated with a given timeline marker.  | <i>AEGP Marker Suite</i>  |
| AEGP_PersistentDataRef     | A "blob" of data containing the current preferences.   | <i>AEGP Persistent Data Suite</i>                                       |
| AEGP_RenderOptionsRef      | The settings associated with a render request.   | <i>AEGP Render Options Suite</i>  |
| AEGP_LayerRenderOptionsRef | The settings associated with a layer render request.   | <i>AEGP Layer Render Options Suite</i>                                  |
| AEGP_FrameRef              | A reference to a rendered frame.   | <i>AEGP Render Suite</i>  |
| AEGP_RQItemRef             | An item in the render queue.   | <i>AEGP Render Queue Suite AEGP Render Queue Item Suite</i>             |
| AEGP_OutputModuleRef       | A reference to an output module, attached to a specific AEGP_RQItemRef in the render queue.  | <i>AEGP Output Module Suite</i>   |
| AEGP_SoundDataRef          | The <i>audio settings</i> used for a given layer.  | <i>AEGP Sound Data Suite</i>  |

## 62.2 Nasty, Brutish, and Short

Information about layers, streams, and many other items doesn't survive long; it's often invalidated by user activity.

Anything that modifies the quantity (not quality) of items will invalidate references to those items; adding a keyframe to a stream invalidates references to that stream, but forcing a layer to be rendered doesn't invalidate references to it. Do not cache layer pixels.

Caching references between calls to a specific hook function within your plug-in is not recommended; acquire information when you need it, and forget (release) it as soon as possible.

---

## 62.3 Were You Just Going To Leave That Data Lying Around?

When you ask After Effects to populate and return handles to data structures, it's important that you clean up after yourself. For the following data types, you must call the appropriate disposal routines.

---

## 62.4 Data Types Requiring Disposal

| Data Type                | Disposal function  |
|--------------------------|--|
| AEGP_CollectionH         | AEGP_DisposeCollection, from <i>AEGP_CollectionSuite2</i>  |
| AEGP_FootageH            | AEGP_DisposeFootage, from <i>AEGP_FootageSuite5</i>  |
| AEGP_WorldH              | AEGP_Dispose, from <i>AEGP_WorldSuite3</i><br>Or AEGP_DisposeTexture, from <i>AEGP_CanvasSuite8</i> , if layer texture created using AEGP_RenderTexture) |
| AEGP_EffectRefH          | AEGP_DisposeEffect, from <i>AEGP_EffectSuite4</i>  |
| AEGP_MaskRefH            | AEGP_DisposeMask, from <i>AEGP_MaskSuite6</i>  |
| AEGP_RenderOptionsH      | AEGP_Dispose, from <i>AEGP_RenderQueueMonitorSuite1</i>  |
| AEGP_LayerRenderOptionsH | AEGP_Dispose, from <i>AEGP_LayerRenderOptionsSuite1</i>  |
| AEGP_RenderReceiptH      | AEGP_DisposeRenderReceipt, from <i>AEGP_CanvasSuite8</i>   |

---

## Implementation

---

Because the functionality available through the AEGP API is so vast, and the integration with After Effects so complete, a good deal of design work is necessary to ensure that your plug-in behaves appropriately in all situations.

AEGPs interact with After Effects through PICA function suites.

AEGPs are not loaded in a specific order.

Check the version of the AEGP API (from within your AEGP's entry point function) to confirm whether a given suite will be available.

AEGPs may also use any effect API suite function which doesn't require a PF\_ProgPtr (obtained by effects from PF\_InData).

---

### 63.1 Entry Point

```
A_Err AEGP_PluginInitFuncPrototype(  
    struct SPBasicSuite *pica_basicP,  
    A_long               major_versionL,  
    A_long               minor_versionL,  
    AEGP_PluginID       aegp_plugin_id,  
    AEGP_GlobalRefcon   *global_refconP)
```

The plug-in's entry point, exported in the *PiPL Resources*, is called just once during launch; all other calls to the AEGP go to the functions it's registered.

This is very different from the effect plug-in model, where all communication comes through the same entry point.

Because plug-in load order may vary, it's never a good idea to acquire suites not provided by After Effects during your entry point function. Rather, wait until the appropriate hook function(s).

The AEGP *API Versions* can help distinguish between different versions of After Effects, in case the AEGP needs to behave differently or handle different behavior.

Those other functions are registered as callback hooks. An AEGP that adds menu items must register an UpdateMenuHook function (with a function signature as described in `AE_GeneralPlug.h`) which After Effects can call to determine whether or not to enable those items. Similarly, plug-ins which process commands register a CommandHook (one for all commands).

---

## 63.2 Specialization

AEIOs and Artisans must register with After Effects in order to receive the messaging streams on which they depend.

Like everything else in the AEGP API, this is done through a function suite; in this case, the aptly-named `AEGP_RegisterSuite`.

---

## 63.3 Example: Adding A Menu Item

During your entry point function, use `AEGP_GetUniqueCommand()` from *Command Suite* to obtain a command ID from After Effects, for use with `AEGP_InsertMenuCommand`. Use a different ID for each menu item you add.

Using `AEGP_RegisterSuite`'s `AEGP_RegisterCommandHook()`, tell After Effects which function to call when your menu item(s) are selected. The function you register using `AEGP_RegisterUpdateMenuHook()` enables and disabling your menu item(s). Your menu item(s) will be permanently disabled unless you register a menu updating function.

No matter how many menu items you add, you register only one `CommandHook`. When called, determine which menu item was chosen (based on the command ID), use AEGP PICA suite functions to determine the current state of the project, and act accordingly. For example, keyframing plug-ins may want to disable their menu items unless a (keyframe-able) parameter stream is part of the current selection.

---

## 63.4 Private Data

Unlike effects, AEGPs are never unloaded during an After Effects session. Still, that doesn't mean that relying on static and global variables is a good idea.

All hook functions are passed a `plugin_refconPV` for storage information specific to that function. Many AEGP Suite functions take the `aegp_plugin_id` as a parameter; store it in the `global_refconPV` you are passed, either in a structure you allocate or just the ID itself.

Where possible, use these refcons to store information, not statics and global variables. This becomes especially important when dealing with multi-threading issues.

Use `global_refconPV` for your globals (like your `aegp_plugin_id`) and `refcon` for hook-function-specific storage.

A potential "multiple instances of After Effects" gotcha; when a second, command-line instance of After Effects is launched, all of an AEGP's handles are duplicated. If this causes problems (and it may), provide code that attaches saved handles to specific instantiations of your plug-in.

---

## 63.5 Threading

AEGP supports no threading at all. Everything must be done from the main thread, either in response to a callback, or from the idle hook.

There is one call that is thread safe: `AEGP_CauseIdleRoutinesToBeCalled()`.

But since `SPBasicSuite` itself is not thread safe, you'll need to stash off the function pointer in the main thread.

# CHAPTER 64

---

## AEGP Suites

---

As mentioned earlier, AEGPs do everything through suites. The following suites are used by all types of AEGPs, and may be called from within any hook function (except for the RegisterSuite, which must be used from within the AEGP's entry point). Following is a description of each function in every suite, and, where appropriate details on using those functions.

| <b>Suite</b>                 | <b>Description</b>  |
|------------------------------|---|
| <i>Memory Suite</i>          | Manage memory resources. Use this suite! Whenever memory-related errors are encountered, After Effects will call this suite.              |
| <i>Command Suite</i>         | Manage your AEGP's menu items. Used in conjunction with the Register Suite.   |
| <i>Register Suite</i>        | Used in conjunction with the <i>Command Suite</i> to add functions to menu commands. AEIOs and Artisans use this suite.                   |
| <i>Project Suite</i>         | Reads and modifies project data.  |
| <i>Item Suite</i>            | Manages items within a project or composition. Folders, Compositions, Solids, and Footage are all item types.                             |
| <i>Collection Suite</i>      | Query which items are currently selected, and create your own selection sets. It's often a good UI move to use this suite.                |
| <i>Composition Suite</i>     | Manages (and creates) compositions in a project, and composition-specific items like solids.  |
| <i>Footage Suite</i>         | Manages footage.  |
| <i>Layer Suite</i>           | Provides information about the layers within a composition, and the relationship(s) between the source and the layer.                     |
| <i>Effect Suite</i>          | Provides access to the effects applied to a layer. Use Stream suites to obtain effect keyframe information.                               |
| <i>Stream Suite</i>          | Used to access the values of a layer's keyframe properties.   |
| <i>Dynamic Stream Suite</i>  | Used to access the characteristics of dynamic streams associated with a layer.  |
| <i>Keyframe Suite</i>        | Used to access and manipulate all keyframe data.  |
| <i>Marker Suite</i>          | Used to manipulate markers. Use <code>AEGP_GetNewCompMarkerStream()</code> (in <i>AEGP_CompSuite11</i> ) to get a marker stream.          |
| <i>Mask Suite</i>            | Provides access to retrieve information about a layer's masks.  |
| <i>Mask Outline Suite</i>    | Used in conjunction with Stream Suite, this suite provides detailed information about the path rendered by a mask.                        |
| <i>Text Document Suite</i>   | Used to access the actual text on a text layer.   |
| <i>Text Layer Suite</i>      | Used to access the paths that make up the outlines of a text layer.   |
| <i>Utility Suite</i>         | Supplies error message handling, AEGP version checking and access to After Effects' undo stack.   |
| <i>Persistent Data Suite</i> | Query and manage all persistent data (i.e., the preferences file). AEGPs can also add their own data to the preferences file.             |
| <i>Color Settings Suite</i>  | Obtain information on After Effects' current color management settings.   |
| <i>Render Suite</i>          | Get rendered frames (and audio samples) from within an AEGP.  |
| <i>World Suite</i>           | Allocate, dispose of, and query AEGP_Worlds. Also provides a way to convert a <code>PF_EffectWorld</code> to an <code>AEGP_World</code> . |
| <i>Composite Suite</i>       | Exposes After Effects' compositing functionality, including transfer modes, track matting, and good old <code>PF_EffectWorld</code> .     |

| <b>Suite</b>                     | <b>Description</b>   |
|----------------------------------|--|
| <i>Sound Data Suite</i>          | Functions for managing and accessing sound data.   |
| <i>Render Queue Suite</i>        | Add and remove items from the render queue.  |
| <i>Render Queue Item Suite</i>   | Query and modify items in the render queue.  |
| <i>Render Options Suite</i>      | Query and manage all items exposed in a render queue item's options dialog.                                      |
| <i>Output Module Suite</i>       | Query and modify the output modules attached to items in the render queue.                                       |
| <i>PF Interface Suite</i>        | The functions in this suite, while technically part of the AEGP API, are for use by effects.                     |
| <i>AEGP Iterate Suite</i>        | Gives AEGPs a way to have a function (which has the required signature) to be run on any or all available items. |
| <i>File Import Manager Suite</i> | Registers AEGP file and project importers as part of After Effects' file handling.                               |

---

## 64.1 Fail Gracefully

If a suite isn't present, make every attempt to fail gracefully. Show the user a message indicating the nature of the problem. Attempt to acquire and use an earlier version of the same suite.

Since AEGPs are so deeply integrated with After Effects, make sure that users know who or what is encountering a given problem.

Identify yourself! Provide support and/or help information to the user whenever possible.

---

## 64.2 Handling Handles

Use the AEGP Memory Suite to manage memory used by the AEGP. Whenever memory related errors are encountered, After Effects can report errors for you to find early on.

`AEGP_MemHandle` is a structure that contains more than just the referenced memory. So it should not be dereferenced directly. Use `AEGP_LockMemHandle` to get a pointer to the memory referenced by the `AEGP_MemHandle`.

And of course, unlock it when you're done.

## 64.2.1 AEGP\_MemorySuite1

| Function               | Purpose   |
|------------------------|---|
| AEGP_NewMemHandle      | <p>Create a new memory handle. This memory is guaranteed to be 16-byte aligned. <code>plugin_id</code> is the ID passed in through the main <i>Entry Point</i>, or alternatively what you obtained from <code>AEGP_RegisterWithAEGP()</code> (from <i>AEGP_UtilitySuite6</i>).</p> <p>Use <code>whatZ</code> to identify the memory you are asking for. After Effects uses the string to display any related error messages.</p> <pre>AEGP_NewMemHandle(     AEGP_PluginID    *plugin_id,     const A_char     *whatZ,     AEGP_MemSize     size,     AEGP_MemFlag     flags,     AEGP_MemHandle   *memPH);</pre> |
| AEGP_FreeMemHandle     | <p>Release a handle you allocated using <code>AEGP_NewMemHandle()</code>.</p> <pre>AEGP_FreeMemHandle(     AEGP_MemHandle memH);</pre>  |
| AEGP_LockMemHandle     | <p>Locks the handle into memory (cannot be moved by OS). Use this function prior to using memory allocated by <code>AEGP_NewMemHandle</code>. Can be nested.</p> <pre>AEGP_LockMemHandle(     AEGP_MemHandle memH,     void            **ptr_to_ptr);</pre>   |
| AEGP_UnlockMemHandle   | <p>Allows OS to move the referenced memory. Always balance lock calls with unlocks.</p> <pre>AEGP_UnlockMemHandle(     AEGP_MemHandle memH);</pre>  |
| AEGP_GetMemHandleSize  | <p>Returns the allocated size of the handle.</p> <pre>AEGP_GetMemHandleSize AEGP_MemHandle_ ↔memH,     AEGP_MemSize    *sizeP);</pre>   |
| AEGP_ResizeMemHandle   | <p>Changes the allocated size of the handle.</p> <pre>AEGP_ResizeMemHandle(     const char      *whatZ,     AEGP_MemSize    new_size,     AEGP_MemHandle  memH);</pre>  |
| AEGP_SetMemReportingOn | <p>If After Effects runs into problems with the memory handling, the error should be reported to the user. Make use of this during development!</p> <p>Only memory allocated and then leaked using this suite is reported using this call, so for example memory allocated using <i>PF_HandleSuite1</i> will not be reported.</p> <pre>AEGP_SetMemReportingOn(     A_Boolean    turn_OnB);</pre>  |
| AEGP_GetMemStats       | <p>Obtain information about the number of currently allocated handles and their total size.</p> <p>Only memory allocated using this suite is tracked and reported using this call, so for example memory allocated using <i>PF_HandleSuite1</i> will not be reported here.</p>  |

## 64.3 Managing Menu Items

Command Suites allow you to create and handle any menu events.

To add your own menu commands, you must also use *Register Suite* to assign handlers to menu events.

## 64.3.1 AEGP\_CommandSuite1

| Function                         | Purpose  |
|----------------------------------|--|
| AEGP_GetUniqueCommand            | <p>Obtain a unique command identifier. Use the <i>Register Suite</i> to register a handler for the command.</p> <pre>AEGP_GetUniqueCommand(     AEGP_Command *unique_commandP);</pre> <p>Note: On occasion After Effects will send command 0 (zero), so don't use that as part of your command handling logic.</p>   |
| AEGP_InsertMenuCommand           | <p>Add a new menu command. Using nameZ = "-" will insert a separator. menu_ID can be:</p> <ul style="list-style-type: none"> <li>• AEGP_Menu_NONE</li> <li>• AEGP_Menu_APPLE</li> <li>• AEGP_Menu_FILE</li> <li>• AEGP_Menu_EDIT</li> <li>• AEGP_Menu_COMPOSITION</li> <li>• AEGP_Menu_LAYER</li> <li>• AEGP_Menu_EFFECT</li> <li>• AEGP_Menu_WINDOW</li> <li>• AEGP_Menu_FLOATERS</li> <li>• AEGP_Menu_KF_ASSIST</li> <li>• AEGP_Menu_IMPORT</li> <li>• AEGP_Menu_SAVE_FRAME_AS</li> <li>• AEGP_Menu_PREFS</li> <li>• AEGP_Menu_EXPORT</li> <li>• AEGP_Menu_ANIMATION</li> <li>• AEGP_Menu_PURGE</li> <li>• AEGP_Menu_NEW - Supported in CC and later</li> </ul> <p>Locations can be set to a specific location in the menu or can be one assigned by After Effects:</p> <ul style="list-style-type: none"> <li>• AEGP_MENU_INSERT_SORTED</li> <li>• AEGP_MENU_INSERT_AT_BOTTOM</li> <li>• AEGP_MENU_INSERT_AT_TOP</li> </ul> <p>For AEGP_Menu_WINDOW, the BOTTOM and TOP options haven't been supported since CS4 and will return an error. We recommend SORTED.</p> <pre>AEGP_InsertMenuCommand(     AEGP_Command command,     const A_char *nameZ,     AEGP_MenuID menu_id,     A_long after_itemL);</pre> |
| AEGP_RemoveMenuCommand           | <p>Remove a menu command. If you were so motivated, you could remove ALL of the After Effects menu items.</p> <pre>AEGP_RemoveMenuCommand(     AEGP_Command command);</pre>  |
| AEGP_SetCommandName              | <p>Set menu name of a command.</p> <pre>AEGP_SetCommandName(     AEGP_Command command,     const A_char *nameZ);</pre>   |
| AEGP_EnableCommand               | <p>Enable a menu command.</p> <pre>AEGP_EnableCommand(     AEGP_Command command);</pre>  |
| <b>64.3. Managing Menu Items</b> | <b>229</b>   |
| AEGP_DisableCommand              | <p>Disable a menu command.</p> <pre>AEGP_DisableCommand(     AEGP_Command command);</pre>  |

## 64.4 Registering with After Effects

Register functions for After Effects' use.

## 64.4.1 AEGP\_RegisterSuites5

| Function                     | Purpose  |
|------------------------------|--|
| AEGP_RegisterCommandHook     | <p>Register a hook (command handler) function with After Effects.</p> <p>If you are replacing a function which After Effects also handles, AEGP_HookPriority determines whether your plug-in gets it first.</p> <ul style="list-style-type: none"> <li>• AEGP_HP_BeforeAE</li> <li>• AEGP_HP_AfterAE</li> </ul> <p>For each menu item you add, obtain your own AEGP_Command using AEGP_GetUniqueCommand() (from <i>AEGP_CommandSuite1</i>) prior registering a single command_hook_func.</p> <p>Determine which command was sent within this hook function, and act accordingly.</p> <p>Currently, AEGP_HookPriority is ignored.</p> <pre>AEGP_RegisterCommandHook (   AEGP_PluginID      aegp_plugin_id,   AEGP_HookPriority   hook_priority,   AEGP_Command       command,   AEGP_CommandHook   command_hook_func   void               *refconPV);</pre> |
| AEGP_RegisterUpdateMenuHook  | <p>Register your menu update function (which determines whether or not items are active), called every time any menu is to be drawn.</p> <p>This hook function handles updates for all menus.</p> <pre>AEGP_RegisterUpdateMenuHook (   AEGP_PluginID      aegp_plugin_id,   AEGP_UpdateMenuHook update_menu_hook_   ↪func,   void               *refconPV);</pre>  |
| AEGP_RegisterDeathHook       | <p>Register your termination function. Called when the application quits.</p> <pre>AEGP_RegisterDeathHook (   AEGP_PluginID      aegp_plugin_id,   AEGP_DeathHook     death_hook_func,   void               *refconPV);</pre>  |
| AEGP_RegisterVersionHook     | Currently not called.  |
| AEGP_RegisterAboutStringHook | Currently not called.  |
| AEGP_RegisterAboutHook       | Currently not called.  |
| AEGP_RegisterArtisan         | <p>Register your Artisan. See <i>Artisans</i> for more details.</p> <pre>AEGP_RegisterArtisan (   A_Version           api_version,   A_Version           Artisan_version,   long               aegp_plugin_id,   void               *aegp_refconPV,   const A_char       *match_nameZ,   const A_char       *Artisan_nameZ,   PR_ArtisanEntryPoints *entry_funcsP);</pre>  |
| AEGP_RegisterIO              | Register your AEIO plug-in. See <i>AEIOs</i> for more details.   |
| 232                          | <p style="text-align: right;"><b>Chapter 64. AEGP Suites</b></p> <pre>AEGP_RegisterIO (   AEGP_PluginID      aegp_plugin_   ↪id,   AEGP_IORefcon      aegp</pre>   |

## 64.5 Manage Projects

These functions access and modify project data. Support for multiple projects is included to prepare for future expansion; After Effects currently adheres to the single project model.

To save project-specific data in After Effects' preferences (and thus, outside the projects themselves), use the *Persistent Data Suite*.

Use caution: the functions for opening and creating projects do not save changes to the project currently open when they are called!

### 64.5.1 AEGP\_ProjSuite6

| Function                     | Purpose  |
|------------------------------|--|
| AEGP_NumProjects             | Currently will never return more than 1. After Effects can have only one project open at a time.<br><br>AEGP_GetNumProjects(<br>A_long *num_projPL)  |
| AEGP_GetIndProject           | Retrieves a specific project by index.<br><br>AEGP_GetProjectProjectByIndex(<br>A_long proj_indexL,<br>AEGP_ProjectH *projPH);   |
| AEGP_GetProjectName          | Get the project name (up to AEGP_MAX_PROJ_NAME_LEN + 1) in length.<br><br>AEGP_GetProjectName(<br>AEGP_ProjectH projH,<br>A_char *nameZ);  |
| AEGP_GetProjectPath          | Get the path of the project (empty string the project hasn't been saved yet). The path is a handle to a NULL-terminated A_UTF16Char string, and must be disposed with AEGP_FreeMemHandle.<br><br>AEGP_GetProjectPath(<br>AEGP_ProjectH projH,<br>AEGP_MemHandle *unicode_pathPH)   |
| AEGP_GetProjectRootFolder    | Get the root of the project, which After Effects also treats as a folder.<br><br>AEGP_GetProjectRootFolder(<br>AEGP_ProjectH projH,<br>AEGP_ItemH *root_folderPH)  |
| AEGP_SaveProjectToPath       | Saves the entire project to the specified full path. The file path is a NULL-terminated UTF-16 string with platform separators.<br><br>AEGP_SaveProjectToPath(<br>AEGP_ProjectH projH,<br>const A_UTF16Char *pathZ);   |
| AEGP_GetProjectTimeDisplay   | Retrieves the current time display settings.<br><br>AEGP_GetProjectTimeDisplay(<br>AEGP_ProjectH projH,<br>AEGP_TimeDisplay3 *time_displayP);<br><br><b>typedef struct</b> {<br>AEGP_TimeDisplayMode                     ┌<br>↪display_mode;<br>AEGP_SourceTimecodeDisplayMode       ┌<br>↪footage_display_mode;<br>A_Boolean                               ┌<br>↪display_dropframeB;<br>A_Boolean                               use_<br>↪feet_framesB;<br>A_char                                   ┌<br>↪timebaseC;<br>A_char                                   frames_235<br>↪per_footC;<br>AEGP_FramesDisplayMode               frames_<br>↪display_mode;<br>} AEGP_TimeDisplay3; |
| <b>64.5. Manage Projects</b> |  |

## 64.5.2 AEGP\_TimeDisplay2

**Note:** Values in unused fields persist when After Effects is using a different display type.

| Member                         | Description  |
|--------------------------------|--|
| AEGP_TimeDisplayType type;     | One of the following: <ul style="list-style-type: none"> <li>AEGP_TimeDisplayType_TIMECODE</li> <li>AEGP_TimeDisplayType_FRAMES</li> <li>AEGP_TimeDisplayType_FEET_AND_FRAMES</li> </ul> |
| A_char timebaseC;              | 0 - 100. Only used for AEGP_TimeDisplayType_TIMECODE.  |
| A_Boolean non_drop_30B;        | When the timebase is 30 and the item's framerate is 29.97, determines whether to display as non-drop frame.  |
| A_char frames_per_footC;       | Only used for AEGP_TimeDisplayType_FEET_AND_FRAMES.  |
| A_long starting_frameL;        | Usually 0 or 1. Not used when type is usually 0 or 1, not used for AEGP_TimeDisplayType_TIMECODE.  |
| A_Boolean auto_timecode_baseB; | If TRUE, the project timecode display setting is set to auto.  |

## 64.6 Control Items Within Projects

Accesses and modifies items within a project or composition.

Anything in the project bin is an AEGP\_Item. Note that cameras have no source, and thus have no AEGP\_ItemH.

Unless more specificity is required for the function(s) you're using, remain as abstract as possible; AEGP\_Comps are passed into and returned from most functions as AEGP\_Items.

### 64.6.1 AEGP\_ItemSuite9

| Function              | Purpose   |
|-----------------------|---|
| AEGP_GetFirstProjItem | Retrieves the first item in a given project.<br><br><pre>AEGP_GetFirstProjItem(     AEGP_ProjectH projectH,     AEGP_ItemH *itemPH);</pre>  |
| AEGP_GetNextProjItem  | Retrieves the next project item; *next_itemPH will be NULL after the last item.<br><br><pre>AEGP_GetNextProjItem(     AEGP_ProjectH projectH,     AEGP_ItemH itemH,     AEGP_ItemH *next_itemPH);</pre> |

Continued on next page

Table 2 – continued from previous page

| Function            | Purpose   |
|---------------------|---|
| AEGP_GetActiveItem  | <p>If the Project window is active, the active item is the selected item (if only one item is selected). If a Composition, Timeline, or Footage window is active, returns the parent of the layer associated with the front-most tab in the window.</p> <p>Returns NULL if no item is active.</p> <pre>AEGP_GetActiveItem(     AEGP_ItemH *itemPH,</pre>  |
| AEGP_IsItemSelected | <p>Returns true if the Project window is active and the item is selected.</p> <pre>AEGP_IsItemSelected(     AEGP_ItemH itemH,     A_Boolean *selectedPB)</pre>  |
| AEGP_SelectItem     | <p>Toggles the selection state of the item, and (depending on <code>deselect_othersB</code>) can deselect other items. This call selects items in the Project panel. To make selections in the Composition panel, use <code>AEGP_SetSelection</code> from <i>AEGP_CompSuite11</i>.</p> <pre>AEGP_SelectItem(     AEGP_ItemH itemH,     A_Boolean selectB,     A_Boolean deselect_othersB);</pre>  |
| AEGP_GetItemType    | <p>Gets type of an item. Note: solids don't appear in the project, but can be the source to a layer.</p> <pre>AEGP_GetItemType(     AEGP_ItemH itemH,     AEGP_ItemType *item_typeP);</pre> <p>Items are one of the following types:</p> <ul style="list-style-type: none"> <li>• AEGP_ItemType_NONE</li> <li>• AEGP_ItemType_FOLDER</li> <li>• AEGP_ItemType_COMP</li> <li>• AEGP_ItemType_SOLID</li> <li>• AEGP_ItemType_FOOTAGE</li> </ul> |
| AEGP_GetTypeName    | <p>Get name of type. (name length up to <code>AEGP_MAX_TYPE_NAME_LEN + 1</code>).</p> <pre>AEGP_GetTypeName(     AEGP_ItemType item_type,     A_char *nameZ);</pre>   |
| AEGP_GetItemName    | <p>Get item name. (name length has no limit). <code>unicode_namePH</code> points to <code>A_UTF16Char</code> (contains null terminated UTF16 string). It must be disposed with <code>AEGP_FreeMemHandle</code>.</p> <pre>AEGP_GetItemName(     AEGP_PluginID pluginID,     AEGP_ItemH itemH,     AEGP_MemHandle *unicode_namePH);</pre>   |

Table 2 – continued from previous page

| Function                 | Purpose   |
|--------------------------|---|
| AEGP_SetItemName         | <p>Specifies the name of the AEGP_ItemH. (name length has no limit). Undoable.</p> <pre>AEGP_SetItemName (   AEGP_ItemH      itemH,   const A_UTF16Char *nameZ);</pre>  |
| AEGP_GetItemID           | <p>Returns the item's unique ID, which persists across saves and loads of the project.</p> <pre>AEGP_GetItemID (   AEGP_ItemH itemH,   A_long      *item_idPL);</pre>   |
| AEGP_GetItemFlags        | <p>Get properties of an item.</p> <pre>AEGP_GetItemFlags (   AEGP_ItemH      itemH,   AEGP_ItemFlags *item_flagsP);</pre> <p>Flag values (may be OR'd together):</p> <ul style="list-style-type: none"> <li>• AEGP_ItemFlag_MISSING</li> <li>• AEGP_ItemFlag_HAS_PROXY</li> <li>• AEGP_ItemFlag_USING_PROXY</li> <li>• AEGP_ItemFlag_MISSING_PROXY</li> <li>• AEGP_ItemFlag_HAS_VIDEO</li> <li>• AEGP_ItemFlag_HAS_AUDIO</li> <li>• AEGP_ItemFlag_STILL</li> <li>• AEGP_ItemFlag_HAS_ACTIVE_AUDIO</li> </ul> <p>Unlike the HAS_AUDIO flag, this bit flag will set only if the comp has at least one layer where audio is actually on.</p> |
| AEGP_SetItemUseProxy     | <p>Toggle item's proxy usage. Undoable.</p> <pre>AEGP_SetItemUseProxy (   AEGP_ItemH itemH,   A_Boolean  use_proxyB);</pre>   |
| AEGP_GetItemParentFolder | <p>Get folder containing item.</p> <pre>AEGP_GetItemParentFolder (   AEGP_ItemH itemH,   AEGP_ItemH *parent_itemPH);</pre>  |
| AEGP_SetItemParentFolder | <p>Sets an item's parent folder. Undoable.</p> <pre>AEGP_SetItemParentFolder (   AEGP_ItemH itemH,   AEGP_ItemH parent_folderH);</pre>  |
| AEGP_GetItemDuration     | <p>Get duration of item, in seconds.</p> <pre>AEGP_GetItemDuration (   AEGP_ItemH itemH,   A_Time      *durationPT);</pre>  |

Continued on next page

Table 2 – continued from previous page

| Function                     | Purpose   |
|------------------------------|---|
| AEGP_GetItemCurrentTime      | <p>Get current time within item. Not updated while rendering.</p> <pre>AEGP_GetItemCurrentTime (   AEGP_ItemH  itemH,   A_long      *curr_timePT);</pre>  |
| AEGP_GetItemDimensions       | <p>Get width and height of item.</p> <pre>AEGP_GetItemDimensions (   AEGP_ItemH  itemH,   A_long      *widthPL)   A_long      *heightPL);</pre>   |
| AEGP_GetItemPixelAspectRatio | <p>Get the width of a pixel, assuming its height is 1.0, as numerator over denominator.</p> <pre>AEGP_GetItemPixelAspectRatio (   AEGP_ItemH  itemH,   A_Ratio     *ratioPRt);</pre>  |
| AEGP_DeleteItem              | <p>Removes item from all compositions. Undo-able. Do not use the AEGP_ItemH after calling this function.</p> <pre>AEGP_DeleteItem (   AEGP_ItemH  itemH);</pre>   |
| AEGP_GetItemSolidColor       | <p>Removed in AEGP_ItemSuite4. See from <a href="#">AEGP_FootageSuite5</a>.<br/>Given a solid item, return its color.</p> <pre>AEGP_GetItemSolidColor (   AEGP_ItemH  itemH,   PF_Pixel    *PF_Pixel);</pre>  |
| AEGP_SetSolidColor           | <p>Removed in AEGP_ItemSuite4. See from <a href="#">AEGP_FootageSuite5</a>.<br/>Sets the color of an existing solid (error if itemH is not a solid).</p> <pre>AEGP_SetSolidColor (   AEGP_ItemH  itemH,   AEGP_ColorVal  color);</pre>                                |
| AEGP_SetSolidDimensions      | <p>Removed in AEGP_ItemSuite4. See from <a href="#">AEGP_FootageSuite5</a>.<br/>Sets the dimensions of an existing solid (error if itemH is not a solid).</p> <pre>AEGP_SetSolidDimensions (   AEGP_ItemH  itemH,   A_short     widthS,   A_short     heightS);</pre> |

Continued on next page

Table 2 – continued from previous page

| Function                  | Purpose  |
|---------------------------|--|
| AEGP_CreateNewFolder      | <p>Creates a new folder in the project. The newly created folder is allocated and owned by After Effects. Passing NULL for parent_folderH0 creates the folder at the project's root.</p> <pre>AEGP_CreateNewFolder (     const A_UTF16Char *nameZ,     AEGP_ProjectH    projH),     AEGP_ItemH       parentH0),     AEGP_ItemH       *new_folderPH);</pre> |
| AEGP_SetItemCurrentTime   | <p>Sets the current time within a given itemH.</p> <pre>AEGP_SetItemCurrentTime (     AEGP_ItemH    itemH,     const A_Time  *new_timePT);</pre>   |
| AEGP_GetItemCommentLength | <p>Removed in ItemSuite9. Retrieves the length (in characters) of the itemH's comment.</p> <pre>AEGP_GetItemCommentLength (     AEGP_ItemH    itemH,     A_u_long      *buf_sizePLu);</pre>  |
| AEGP_GetItemComment       | <p>Updated to support Unicode in ItemSuite9, available in 14.1. Retrieves the itemH's comment.</p> <pre>AEGP_GetItemComment (     AEGP_ItemH    itemH,     AEGP_MemHandle *unicode_namePH);</pre>  |
| AEGP_SetItemComment       | <p>Updated to support Unicode in ItemSuite9, available in 14.1. Sets the itemH's comment.</p> <pre>AEGP_SetItemComment (     AEGP_ItemH    itemH,     const A_UTF16Char *commentZ);</pre>  |
| AEGP_GetItemLabel         | <p>Retrieves an item's label.</p> <pre>AEGP_GetItemLabel (     AEGP_ItemH    itemH,     AEGP_LabelID  *labelP);</pre>  |
| AEGP_SetItemLabel         | <p>Sets an item's label.</p> <pre>AEGP_SetItemLabel (     AEGP_ItemH    itemH,     AEGP_LabelID  label);</pre>   |
| AEGP_GetItemMRUView       | <p>Gets an item's most recently used view. The view can be used with two calls in the AEGP_ColorSettingsSuite, to perform a color transform on a pixel buffer from working to view color space.</p> <pre>AEGP_GetItemMRUView (     AEGP_ItemH    itemH,     AEGP_ItemViewP *mru_viewP);</pre>  |

---

**Note:** `AEGP_RenderNewItemSoundData ()` used to be here, but is now part of *AEGP\_RenderSuite4*.

---

## 64.7 Managing Selections

This suite manages selection states, mirroring the functionality supplied by vectors in the C++ Standard Template Library.

Many types of items may be simultaneously selected in After Effects; `AEGP_CollectionItems` are unions of layer, mask, effect, stream, mask vertex, and keyframe items.

First acquire the current collection, then iterate across its members to ensure that whatever your AEGP does is applicable to each.

We've added `AEGP_Collection2H` and `AEGP_CollectionItemV2` so that selected dynamic streams can be handled with the `AEGP_CollectionSuite`.

## 64.7.1 AEGP\_CollectionSuite2

| Function                      | Purpose  |
|-------------------------------|--|
| AEGP_NewCollection            | Creates and returns a new, empty collection. To obtain the current composition's selection as a collection, use AEGP_GetNewCollectionFromCompSelection.<br><br><pre>AEGP_NewCollection(   AEGP_PluginID    plugin_id,   AEGP_Collection2H *collectionPH);</pre>  |
| AEGP_DisposeCollection        | Disposes of a collection.<br><br><pre>AEGP_DisposeCollection(   AEGP_Collection2H collectionH);</pre>  |
| AEGP_GetCollectionNumItems    | Returns the number of items contained in the given collection.<br><br><pre>AEGP_GetCollectionNumItems(   AEGP_Collection2H collectionH,   A_u_long          *num_itemsPL);</pre>   |
| AEGP_GetCollectionItemByIndex | Retrieves (creates and populates) the index'd collection item.<br><br><pre>AEGP_GetCollectionItemByIndex(   AEGP_Collection2H    collectionH,   A_u_long             indexL,   AEGP_CollectionItemV2 *itemP);</pre>  |
| AEGP_CollectionPushBack       | Adds an item to the given collection.<br><br><pre>AEGP_CollectionPushBack(   AEGP_Collection2H    collectionH,   AEGP_CollectionItemV2 *itemP);</pre>  |
| AEGP_CollectionErase          | Removes an index'd item (or items) from a given collection. NOTE: this range is exclusive, like STL iterators. To erase the first item, you would pass 0 and 1, respectively.<br><br><pre>AEGP_CollectionErase(   AEGP_Collection2H collectionH,   A_u_long          index_firstL,   A_u_long          index_lastL);</pre> |

## 64.7.2 Ownership Of Collection Items

When AEGP\_StreamRefHs are inserted into a collection, they are adopted by the collection; do not free them.

AEGP\_EffectRefHs, on the other hand, are not adopted, and must be freed by the calling AEGP.

## 64.8 Manipulate Compositions

Provide information about the compositions in a project, and create cameras, lights, and solids.

### 64.8.1 AEGP\_CompSuite11

| Function                                  | Purpose  |
|---|--|
| <code>AEGP_GetCompFromItem</code>         | Retrieves the handle to the composition, given an item handle. Returns NULL if itemH is not an AEGP_CompH.<br><br><pre>AEGP_GetCompFromItem(   AEGP_ItemH  itemH,   AEGP_CompH  *compH);</pre>   |
| <code>AEGP_GetItemFromComp</code>         | Used to get the item handle, given a composition handle.<br><br><pre>AEGP_GetItemFromComp(   AEGP_CompH  compH,   AEGP_ItemH  *itemH);</pre>   |
| <code>AEGP_GetCompDownsampleFactor</code> | Returns current downsample factor. Measured in pixels X by Y. Users can choose a custom downsample factor with independent X and Y.<br><br><pre>AEGP_GetCompDownsampleFactor(   AEGP_CompH          compH,   AEGP_DownsampleFactor *dsfP);</pre> |
| <code>AEGP_SetCompDownsampleFactor</code> | Sets the composition's downsample factor.<br><br><pre>AEGP_SetCompDownsampleFactor(   AEGP_CompH          compH,   AEGP_DownsampleFactor *dsfP);</pre>   |
| <code>AEGP_GetCompBGColor</code>          | Returns the composition background color.<br><br><pre>AEGP_GetCompBGColor(   AEGP_CompH  compH,   AEGP_ColorVal *bg_colorP);</pre>   |
| <code>AEGP_SetCompBGColor</code>          | Sets a composition's background color.<br><br><pre>AEGP_SetCompBGColor(   AEGP_CompH          compH,   const AEGP_ColorVal *bg_colorP);</pre>  |

## 64.9 Work with Footage

Provides information about footage, or items in a project or composition. When getting and setting footage's interpretation, it is possible to specify incompatible options.

If you encounter warnings and errors during development, be sure to make all related changes atomically, and reassess the logic of the operation you're performing.

For example, changing the pull-down interpretation of footage won't work unless there's a difference between it's native and conformed frame rate.

Depending on what you're trying to accomplish, it may make sense to abort all of your operations at that point, inform the user of the problem encountered.

## 64.9.1 AEGP\_FootageSuite5

| Function                       | Purpose   |
|--------------------------------|---|
| AEGP_GetMainFootageFromItem    | Returns an error if item isn't a footage item. Used to convert an item handle to a footage handle.<br><br><pre>AEGP_GetMainFootageFromItem(     AEGP_ItemH      itemH,     AEGP_FootageH  *footagePH);</pre>  |
| AEGP_GetProxyFootageFromItem   | Returns an error if item has no proxy. Returns the proxy footage handle. Note: a composition can have a proxy.<br><br><pre>AEGP_GetProxyFootageFromItem(     AEGP_ItemH      itemH,     AEGP_FootageH  *proxy_ftgPH);</pre>   |
| AEGP_GetFootageNumFiles        | Returns the number of data (RGBA or audio) files, and the number of files per frame (may be greater than one if the footage has auxiliary channels).<br><br><pre>AEGP_GetFootageNumFiles(     AEGP_FootageH  footageH,     A_long         *num_filesPL0,     A_long         *files_per_frmPL0);</pre>   |
| AEGP_GetFootagePath            | Get fully realized path to footage source file. Retrieves the footage path for a piece of footage (or for the specified frame of a footage sequence). <code>frame_numL</code> ranges from 0 to <code>num_main_files</code> , as obtained using <code>AEGP_GetFootageNumFiles</code> from <i>AEGP_FootageSuite5</i> . <code>AEGP_FOOTAGE_MAIN_FILE_INDEX</code> is the main file. The path is a handle to a NULL-terminated <code>A_UTF16Char</code> string, and must be disposed with <i>AEGP_FreeMemHandle</i> .<br><br><pre>AEGP_GetFootagePath(     AEGP_FootageH  footageH,     A_long         frame_numL,     A_long         file_indexL,     AEGP_MemHandle *unicode_pathPH);</pre> |
| AEGP_GetFootageSignature       | Retrieves the footage signature of specified footage.<br><br><pre>AEGP_GetFootageSignature(     AEGP_FootageH      footageH,     AEGP_FootageSignature *sigP);</pre> <p>The signature will be one of the following:</p> <ul style="list-style-type: none"> <li>• <code>AEGP_FootageSignature_NONE</code></li> <li>• <code>AEGP_FootageSignature_MISSING</code></li> <li>• <code>AEGP_FootageSignature_SOLID</code></li> </ul>   |
| AEGP_NewFootage                | Creates a new footage item. The file path is a NULL-terminated UTF-16 string with platform separators. Note that footage filenames with colons are not allowed, since colons are used as path separators in the HFS+ file system.<br><br><pre>AEGP_NewFootage(     AEGP_PluginID     ↪ aegp_plugin_id,     const A_UTF16Char     ↪ *pathZ,     const AEGP_FootageLaverKey</pre>   |
| <b>64.9. Work with Footage</b> | <b>251</b>  |

## 64.9.2 AEGP\_FootageInterp Structure

| Member                    | Purpose   |
|---------------------------|---|
| AEGP_InterlaceLabel il;   | <p>The interlace settings for the footage item.</p> <pre>A_u_long signature; // 'FIEL'</pre> <pre>A_short version;</pre> <pre>FIEL_Type type;</pre> <pre>FIEL_Order order;</pre> <pre>A_u_long reserved;</pre> <p><b>FIEL_Type is one of the following:</b></p> <ul style="list-style-type: none"> <li>• FIEL_Type_FRAME_RENDERED</li> <li>• FIEL_Type_INTERLACED</li> <li>• FIEL_Type_HALF_HEIGHT</li> <li>• FIEL_Type_FIELD_DOUBLED</li> </ul> <p>FIEL_Type_FIELD_DOUBLED means 60 full-sized field doubled frames per second.</p> <pre>FIEL_Order          is          either</pre> <pre>FIEL_Order_UPPER_FIRST          or</pre> <pre>FIEL_Order_LOWER_FIRST.</pre> |
| AEGP_AlphaLabel al;       | <pre>AEGP_AlphaFlag flags;</pre> <pre>A_u_char redCu;</pre> <pre>A_u_char greenCu;</pre> <pre>A_u_char blueCu;</pre> <p>AEGP_AlphaFlags is one or more of the following, OR'd together:</p> <ul style="list-style-type: none"> <li>• AEGP_AlphaPremul</li> <li>• AEGP_AlphaInverted</li> <li>• AEGP_AlphaIgnore</li> </ul> <p>If AEGP_AlphaPremul is not set, straight alpha is assumed. AEGP_AlphaInverted indicates that higher values are transparent, instead of lower.</p>   |
| AEGP_PulldownPhase pd;    | <p>Indicates the phase for use in 3:2 pulldown. One of the following:</p> <ul style="list-style-type: none"> <li>• AEGP_PulldownPhase_NO_PULLDOWN,</li> <li>• AEGP_PulldownPhase_WSSWW,</li> <li>• AEGP_PulldownPhase_SSWWW,</li> <li>• AEGP_PulldownPhase_SWWWS,</li> <li>• AEGP_PulldownPhase_WWWSS,</li> <li>• AEGP_PulldownPhase_WWSSW,</li> <li>• AEGP_PulldownPhase_WWWSW,</li> <li>• AEGP_PulldownPhase_WWSWW,</li> <li>• AEGP_PulldownPhase_WSWWW,</li> <li>• AEGP_PulldownPhase_SWWWW,</li> <li>• AEGP_PulldownPhase_WWWWS</li> </ul>  |
| AEGP_LoopBehavior loop;   | <p>Indicates the number of times the footage should loop.</p> <pre>A_long loops;</pre> <pre>A_long reserved;</pre>  |
| A_Ratio pix_aspect_ratio; | <p>Expresses the pixel aspect ratio of the footage (x over y).</p>  |
| A_FpLong native_fpsF;     | <p>The original framerate (in frames per second) of the footage item.</p>   |
| A_FpLong conform_fpsF;    | <p>The framerate being used for the footage item.</p>   |
| A_long depthL;            | <p>The pixel depth of the footage. One of the following:</p> <ul style="list-style-type: none"> <li>• AEGP_Footage_Depth_1</li> <li>• AEGP_Footage_Depth_2</li> <li>• AEGP_Footage_Depth_4</li> </ul>   |

## 64.10 Manage Layers

`AEGP_LayerSuite` provides information about layers within a composition, and the relationship(s) between the source and layer times.

As most After Effects usage boils down to layer manipulation, this is among the largest function suites in our API.

### 64.10.1 AEGP\_LayerSuite8

| Function                               | Purpose   |
|--|---|
| <code>AEGP_GetCompNumLayers</code>     | Obtains the number of layers in a composition.<br><br><pre>AEGP_GetCompNumLayers (     AEGP_CompH    compH,     A_long        *num_layersPL);</pre>   |
| <code>AEGP_GetCompLayerByIndex</code>  | Get a <code>AEGP_LayerH</code> from a composition. Zero is the foremost layer.<br><br><pre>AEGP_GetCompLayerByIndex (     AEGP_CompH    compH,     A_long        layer_indexL,     AEGP_LayerH   *layerPH);</pre>   |
| <code>AEGP_GetActiveLayer</code>       | Get the active layer. If a Layer or effect controls palette is active, the active layer is that associated with the front-most tab in the window. If a composition or timeline window is active, the active layer is the selected layer (if only one is selected; otherwise NULL is returned).<br><br><pre>AEGP_GetActiveLayer (     AEGP_LayerH   *layerPH);</pre> |
| <code>AEGP_GetLayerIndex</code>        | Get the index of the layer (0 is the topmost layer in the composition).<br><br><pre>AEGP_GetLayerIndex (     AEGP_LayerH   layerH,     A_long        *layer_indexPL);</pre>   |
| <code>AEGP_GetLayerSourceItem</code>   | Get the <code>AEGP_ItemH</code> of the layer's source item.<br><br><pre>AEGP_GetLayerSourceItem (     AEGP_LayerH   layerH,     AEGP_ItemH    *source_itemPH);</pre>  |
| <code>AEGP_GetLayerSourceItemID</code> | Retrieves the ID of the given <code>AEGP_LayerH</code> . This is useful when hunting for a specific layer's ID in an <code>AEGP_StreamVal</code> .<br><br><pre>AEGP_GetLayerSourceItemID (     AEGP_LayerH   layerH,     A_long        *source_idPL);</pre>   |

Table 4 – continued from previous page

| Function                | Purpose  |
|-------------------------|--|
| AEGP_GetLayerParentComp | <p>Get the AEGP_CompH of the composition containing the layer.</p> <pre>AEGP_GetLayerParentComp (   AEGP_LayerH  layerH,   AEGP_CompH   *compPH);</pre>  |
| AEGP_GetLayerName       | <p>Get the name of a layer. Both utf_layer_namePH0 and utf_source_namePH0 point to null terminated UTF-16 strings. They must be disposed with AEGP_FreeMemHandle.</p> <pre>AEGP_GetLayerName (   AEGP_PluginID  pluginID,   AEGP_LayerH    layerH,   AEGP_MemHandle *utf_layer_namePH0,   AEGP_MemHandle *utf_source_namePH0);</pre>                           |
| AEGP_GetLayerQuality    | <p>Get the quality of a layer.</p> <pre>AEGP_GetLayerQuality (   AEGP_LayerH      layerH,   AEGP_LayerQuality *qualityP);</pre> <p>Layer quality is one of the following flags:</p> <ul style="list-style-type: none"> <li>• AEGP_LayerQual_NONE</li> <li>• AEGP_LayerQual_WIREFRAME</li> <li>• AEGP_LayerQual_DRAFT</li> <li>• AEGP_LayerQual_BEST</li> </ul> |
| AEGP_SetLayerQuality    | <p>Sets the quality of a layer (see flag values above). Undoable.</p> <pre>AEGP_SetLayerQuality (   AEGP_LayerH      layerH,   AEGP_LayerQuality quality);</pre>   |

Continued on next page

Table 4 – continued from previous page

| Function                         | Purpose  |
|----------------------------------|--|
| <p>AEGP_GetLayerFlags</p>        | <p>Get flags for a layer.</p> <pre>AEGP_GetLayerFlags (   AEGP_LayerH      layerH,   AEGP_LayerFlags *layer_flagsP);</pre> <ul style="list-style-type: none"> <li>• AEGP_LayerFlag_NONE</li> <li>• AEGP_LayerFlag_VIDEO_ACTIVE,</li> <li>• AEGP_LayerFlag_AUDIO_ACTIVE,</li> <li>• AEGP_LayerFlag_EFFECTS_ACTIVE,</li> <li>• AEGP_LayerFlag_MOTION_BLUR,</li> <li>• AEGP_LayerFlag_FRAME_BLENDING,</li> <li>• AEGP_LayerFlag_LOCKED,</li> <li>• AEGP_LayerFlag_SHY,</li> <li>• AEGP_LayerFlag_COLLAPSE,</li> <li>• AEGP_LayerFlag_AUTO_ORIENT_ROTATION,</li> <li>• AEGP_LayerFlag_ADJUSTMENT_LAYER,</li> <li>• AEGP_LayerFlag_TIME_REMAPPING,</li> <li>• AEGP_LayerFlag_LAYER_IS_3D,</li> <li>• AEGP_LayerFlag_LOOK_AT_CAMERA,</li> <li>• AEGP_LayerFlag_LOOK_AT_POI,</li> <li>• AEGP_LayerFlag_SOLO,</li> <li>• AEGP_LayerFlag_MARKERS_LOCKED,</li> <li>• AEGP_LayerFlag_NULL_LAYER,</li> <li>• AEGP_LayerFlag_HIDE_LOCKED_MASKS,</li> <li>• AEGP_LayerFlag_GUIDE_LAYER,</li> <li>• AEGP_LayerFlag_ENVIRONMENT_LAYER,</li> <li>• AEGP_LayerFlag_ADVANCED_FRAME_BLENDING,           <p>True only if pixel motion frame blending is on for the layer.</p> </li> <li>• AEGP_LayerFlag_SUBLAYERS_RENDER_SEPARATELY,           <p>Used to get/set the state of per-character 3D enablement on a text layer.</p> </li> <li>• AEGP_LayerFlag_ENVIRONMENT_LAYER,           <p>New in CS6.</p> </li> </ul> |
| <p>AEGP_SetLayerFlag</p>         | <p>Sets one layer flag at a time. Undoable.</p> <pre>AEGP_SetLayerFlag (   AEGP_LayerH      layerH,   AEGP_LayerFlags  single_flag,   A_Boolean        valueB);</pre>  |
| <p>AEGP_IsLayerVideoReallyOn</p> | <p>Determines whether the layer’s video is visible. This is necessary to account for ‘solo’ status of other layers in the composition; non-solo’d layers are still on.</p> <pre>AEGP_IsLayerVideoReallyOn (   AEGP_LayerH  layerH,   A_Boolean    *onPB);</pre>  |

Continued on next page

Table 4 – continued from previous page

| Function                        | Purpose   |
|---------------------------------|---|
| AEGP_IsLayerAudioReallyOn       | Accounts for solo status of other layers in the composition.<br><br><pre>AEGP_IsLayerAudioReallyOn (     AEGP_LayerH    layerH,     A_Boolean      *onPB);</pre>  |
| AEGP_GetLayerCurrentTime        | Get current time, in layer or composition timespace. This value is not updated during rendering.<br>NOTE: If a layer starts at other than time 0 or is time-stretched other than 100%, layer time and composition time are distinct.<br><br><pre>AEGP_GetLayerCurrentTime (     AEGP_LayerH    layerH,     AEGP_LTimeMode time_mode,     A_Time          *curr_timePT);</pre> |
| AEGP_GetLayerInPoint            | Get time of first visible frame in composition or layer time. In layer time, the in_pointPT is always 0.<br><br><pre>AEGP_GetLayerInPoint (     AEGP_LayerH    layerH,     AEGP_LTimeMode time_mode,     A_Time          *in_pointPT);</pre>  |
| AEGP_GetLayerDuration           | Get duration of layer, in composition or layer time, in seconds.<br><br><pre>AEGP_GetLayerDuration (     AEGP_LayerH    layerH,     AEGP_LTimeMode time_mode,     A_Time          *durationPT);</pre>   |
| AEGP_SetLayerInPointAndDuration | Set duration and in point of layer in composition or layer time. Undo-able.<br><br><pre>AEGP_SetLayerInPointAndDuration (     AEGP_LayerH    layerH,     AEGP_LTimeMode time_mode,     const A_Time    *in_pointPT,     const A_Time    *durationPT);</pre>   |
| AEGP_GetLayerOffset             | Get the offset from the start of the composition to layer time 0, in composition time.<br><br><pre>AEGP_GetLayerOffset (     AEGP_LayerH    layerH,     A_Time          *offsetPT);</pre>   |
| AEGP_SetLayerOffset             | Set the offset from the start of the composition to the first frame of the layer, in composition time. Undoable.<br><br><pre>AEGP_SetLayerOffset (     AEGP_LayerH    layerH,     A_Time          *offsetPT);</pre>   |

Continued on next page

Table 4 – continued from previous page

| Function                  | Purpose  |
|---------------------------|--|
| AEGP_GetLayerStretch      | <p>Get stretch factor of a layer.</p> <pre>AEGP_GetLayerStretch(   AEGP_LayerH  layerH,   A_Ratio      *stretchPRt);</pre>   |
| AEGP_SetLayerStretch      | <p>Set stretch factor of a layer.</p> <pre>AEGP_SetLayerStretch(   AEGP_LayerH  layerH,   A_Ratio      *stretchPRt);</pre>   |
| AEGP_GetLayerTransferMode | <p>Get transfer mode of a layer.</p> <pre>AEGP_GetLayerTransferMode(   AEGP_LayerH          layerH,   AEGP_LayerTransferMode *modeP);</pre>  |
| AEGP_SetLayerTransferMode | <p>Set transfer mode of a layer. Undoable.</p> <pre>AEGPSetLayerTransferMode(   AEGP_LayerH          layerH,   AEGP_LayerTransferMode *modeP);</pre> <p>As of 6.5, when you make a layer a track matte, the layer in front of it will be disabled, as when you do this via the interface.</p>  |
| AEGP_IsAddLayerValid      | <p>Tests whether it's currently valid to add a given item to a composition. A composition cannot be added to itself, or to any compositions which it contains; other conditions can preclude successful adding too. Adding a layer without first using this function will produce undefined results.</p> <pre>AEGP_IsAddLayerValid(   AEGP_ItemH  item_to_addH,   AEGP_CompH  into_compH,   A_Boolean   *validPB);</pre> |
| AEGP_AddLayer             | <p>Add an item to the composition, above all other layers. Undo-able. Use AEGP_IsAddLayerValid() first, to confirm that it's possible.</p> <pre>AEGP_AddLayer(   AEGP_ItemH  item_to_addH,   AEGP_CompH  into_compH,   A_Boolean   *added_layerPH0);</pre>   |

Get the sampling quality of a layer.<br><br><pre>AEGP_GetLayerSamplingQuality (   AEGP_LayerH      layerH,   AEGP_LayerSamplingQuality *label);</pre> <p>Layer sampling quality is one of the following flags:</p> <ul style="list-style-type: none"> <li>• AEGP_LayerSamplingQual_BILINEAR</li> <li>• AEGP_LayerSamplingQual_BICUBIC</li> </ul> |

Continued on next page

Table 4 – continued from previous page

| Function                                  | Purpose  |
|---|--|
| <code>AEGP_SetLayerSamplingQuality</code> | <p>New in CC. Sets the sampling quality of a layer (see flag values above). Option is explicitly set on the layer independent of layer quality. If you want to force it on you must also set the layer quality to <code>AEGP_LayerQual_BEST</code> with <code>AEGP_SetLayerQuality</code>. Otherwise it will only be using the specified layer sampling quality whenever the layer quality is set to <code>AEGP_LayerQual_BEST</code>. Undoable.</p> <pre>AEGP_SetLayerSamplingQuality(     AEGP_LayerH          layerH,     AEGP_LayerSamplingQuality label);</pre> |

## 64.11 Layer Creation Notes

All layers created using AEGP calls will start at composition time 0, and have the duration of the composition.

Use `AEGP_SetLayerOffset()` and `AEGP_SetLayerInPointAndDuration()` from *AEGP\_LayerSuite8* to properly set the layer's time information.

When the layer stretch factor (obtained using `AEGP_GetLayerStretch` in *AEGP\_LayerSuite8*, naturally) is not 100%, the following computation will be needed to yield the correct layer offset:

```
offset = compIn - stretch * layerIn;
```

## 64.12 Communication With A Layer's Effects

Access the effects applied to a layer. This suite provides access to all parameter data streams.

Use the *Stream Suite* to work with those streams.

An `AEGP_Effect_RefH` is a reference to an applied effect. An `AEGP_InstalledEffectKey` is a reference to an installed effect, which may or may not be currently applied to anything.

If Foobarocity is applied to a layer twice, there will be two distinct `AEGP_Effect_RefHs`, but they'll both return the same `AEGP_InstalledEffectKey`.

### 64.12.1 AEGP\_EffectSuite4

| Function                            | Purpose   |
|-------------------------------------|---|
| AEGP_GetLayerNumEffects             | <p>Get number of effects applied to a layer.</p> <pre>AEGP_GetLayerNumEffects (     AEGP_LayerH    layerH,     A_long         *num_effectsP);</pre>   |
| AEGP_GetLayerEffectByIndex          | <p>Retrieves (by index) a reference to an effect applied to the layer.</p> <pre>AEGP_GetLayerEffectByIndex (     AEGP_PluginID    aegp_plugin_id,     AEGP_LayerH      layerH,     AEGP_EffectIndex effect_indexL,     AEGP_EffectRefH *effectPH);</pre>  |
| AEGP_GetInstalledKeyFromLayerEffect | <p>Given an AEGP_EffectRefH, retrieves its associated AEGP_InstalledEffectKey.</p> <pre>AEGP_GetInstalledKeyFromLayerEffect (     AEGP_EffectRefH    effect_refH,     AEGP_InstalledEffectKey *installed_     ↪keyP);</pre>   |
| AEGP_GetEffectParamUnionByIndex     | <p>Returns description of effect parameter. Do not use the value(s) in the ParamDef returned by this function (Use AEGP_GetNewStreamValue() instead); it's provided so AEGPs can access parameter defaults, checkbox names, and pop-up strings.</p> <p>Use AEGP_GetEffectNumParamStreams() from <i>AEGP_StreamSuite5</i> to get the stream count, useful for determining the maximum param_index. The last parameter is optional;</p> <pre>AEGP_GetEffectParamUnionByIndex (     AEGP_PluginID    aegp_plugin_id,     AEGP_EffectRefH  effectH,     PF_ParamIndex    param_index,     PF_ParamType     *param_typeP     PF_ParamDefUnion *uP0);</pre> |
| AEGP_GetEffectFlags                 | <p>Obtains the flags for the given AEGP_EffectRefH.</p> <pre>AEGP_GetEffectFlags (     AEGP_EffectRefH  effect_refH,     AEGP_EffectFlags *effect_flagsP);</pre> <p>Flags will be a combination of the following:</p> <ul style="list-style-type: none"> <li>• AEGP_EffectFlags_NONE</li> <li>• AEGP_EffectFlags_ACTIVE</li> <li>• AEGP_EffectFlags_AUDIO_ONLY</li> <li>• AEGP_EffectFlags_AUDIO_TOO</li> <li>• AEGP_EffectFlags_MISSING</li> </ul>   |
| AEGP_SetEffectFlags                 | <p>Sets the flags (enumerated above) for the given AEGP_EffectRefH, masked by a different set of effect flags.</p> <pre>AEGP_SetEffectFlags (     AEGP_EffectRefH  effect_refH,     AEGP_EffectFlags mask,     AEGP_EffectFlags effect_flags);</pre>  |
| 264                                 | <p><b>Chapter 64. AEGP Suites</b></p>   |
| AEGP_ReorderEffect                  | <p>Change the order of applied effects (pass the requested index).</p>  |

## 64.13 Exploiting Effect UI Behavior To Look Cool

Even if you manipulate a layer's effects, its effect controls won't necessarily become visible.

However, if you apply then immediately remove an effect, the layer's effect controls will be made visible.

Tricky, eh?

---

## 64.14 StreamRefs And EffectRefs

How do you get an `AEGP_StreamRef` for an effect? Start by getting the effect's `AEGP_EffectRef`, by calling `AEGP_GetNewEffectForEffect()`.

Then call `AEGP_GetNewEffectStreamByIndex()`, say for param index 1, which passes back a parameter stream.

Then call `AEGP_GetNewParentStreamRef()` - voila, your `AEGP_StreamRef` sir!

If you acquire references to an effect's streams, do not dispose of the `AEGP_EffectRefH` until you're done with the streams, or you'll unbalance After Effects' checkout mechanism. Also remember that `AEGP_StreamRefH`s are opaque; `AEGP_StreamValue2s` are not (entirely).

To get an effect's instance name (as renamed by the user), get the `AEGP_StreamRef` for the effect itself and call `AEGP_GetStreamName`.

---

## 64.15 Diving Into Streams!

Just about everything in After Effects is a stream. Effect parameters, layers, masks, and shapes are all internally represented by streams. The AEGP API can access nearly every aspect of every stream.

The After Effects timeline can contain numerous object types; each object supports a set of parameters called streams. All streams, regardless of which type of object to which they're attached, are conceptually similar (and handled similarly by After Effects). But the way you access each type of stream varies because of their containment.

A stream, once acquired, represents a value which may change over time. Not all streams *can* vary over time, and a particular stream may not be time-variant at the time of access.

There are two ways to access the value of a stream. If the stream has keyframes, you can use the *Working With Keyframes*. The values provided won't reflect the influence of expressions. Note: In any expression, the current keyframed value is always available as the variable value.

You can also use `AEGP_GetNewStreamValue` from *AEGP\_StreamSuite5*, which samples the value of the stream at a particular time. For streams without expressions or keyframes, the time parameter is meaningless, and the function returns what essentially is the constant value of the stream. Use `AEGP_SetStreamValue` (which doesn't take a time as a parameter) to set these streams.

Many StreamSuite functions populate a `StreamH`, which your AEGP must dispose. when done. After Effects allocates and passes you a copy of the values, not a direct handle to the original value. `AEGP_GetNewLayerStream()` is restricted to streams for which no memory allocation is required to access their values.

---

## 64.16 Okay, What Did I Just Get?

A stream value is a large union, only one structure of which (depending on the stream type) is populated. Note the similarity to the *PF\_ParamDef*.

```
typedef union {
    AEGP_FourDVal      four_d;
    AEGP_ThreeDVal    three_d;
    AEGP_TwoDVal      two_d;
    AEGP_OneDVal      one_d;
    AEGP_ColorVal     color;
    AEGP_ArbBlockVal  arbH;
    AEGP_MarkerValP   markerP;
    AEGP_LayerIDVal   layer_id;
    AEGP_MaskIDVal    mask_id;
    AEGP_MaskOutlineValH mask;
    AEGP_TextDocumentH text_documentH;
} AEGP_StreamVal2;
```

---

## 64.17 Layers

`AEGP_GetLayerStreamValue` is used to access the parameters like anchor point and position, native to almost all layers in AE.

Use `IsStreamLegal` to allow you to determine if that stream type is offered on that layer.

---

## 64.18 Masks

Since a layer can have multiple masks, access the masks using `AEGP_GetLayerMaskByIndex` from *AEGP\_MaskSuite6*.

Masks don't have streams like layers do; they get their own enumeration. Access their streams using `AEGP_GetNewMaskStream` from *AEGP\_StreamSuite5*.

---

## 64.19 Effects

They can have a variable number of streams/parameters, and the order and definition of them is not known when the AEGP is written.

Therefore we cannot offer an enum for selecting them, and instead you must get them by index, hence `GetNewEffectStreamByIndex` from *AEGP\_StreamSuite5*.

---

## 64.20 Stream Suite

Access and manipulate the values of a layer's streams. For paint and text streams, use *Dynamic Streams* instead.

## 64.20.1 AEGP\_StreamSuite5

| Function                    | Purpose  |
|-----------------------------|--|
| AEGP_IsStreamLegal          | <p>Determines if the given stream is appropriate for the given layer.</p> <pre>AEGP_IsStreamLegal (   AEGP_LayerH      layerH,   AEGP_LayerStream which_stream,   A_Boolean*       is_legalP);</pre>   |
| AEGP_CanVaryOverTime        | <p>Given a stream, returns whether or not a stream is time-variant (and can be keyframed).</p> <pre>AEGP_CanVaryOverTime (   AEGP_StreamRefH streamH,   A_Boolean        *can_varyPB);</pre>   |
| AEGP_GetValidInterpolations | <p>Retrieves an <code>AEGP_KeyInterpolationMask</code> indicating which interpolation types are valid for the <code>AEGP_StreamRefH</code>.</p> <pre>AEGP_GetValidInterpolations (   AEGP_StreamRefH      streamH,   AEGP_KeyInterpolationMask *valid_   ↪interpP);</pre> <p><code>AEGP_KeyInterpolationMask</code> will be a combination of the following:</p> <ul style="list-style-type: none"> <li>• <code>AEGP_KeyInterpMask_NONE</code></li> <li>• <code>AEGP_KeyInterpMask_LINEAR</code></li> <li>• <code>AEGP_KeyInterpMask_BEZIER</code></li> <li>• <code>AEGP_KeyInterpMask_HOLD</code></li> <li>• <code>AEGP_KeyInterpMask_CUSTOM</code></li> <li>• <code>AEGP_KeyInterpMask_ANY</code></li> </ul>  |
| AEGP_GetNewLayerStream      | <p>Get a layer's data stream. Plug-in must dispose of <code>streamPH</code>. Note that this will not provide keyframe access; Use the <i>AEGP_KeyframeSuite</i> instead.</p> <pre>AEGP_GetNewLayerStream (   AEGP_PluginID   id,   AEGP_LayerH     layerH,   AEGP_LayerStream which_stream,   AEGP_StreamRefH *streamPH);</pre> <ul style="list-style-type: none"> <li>• <code>AEGP_LayerStream_ANCHORPOINT</code>,</li> <li>• <code>AEGP_LayerStream_POSITION</code>,</li> <li>• <code>AEGP_LayerStream_SCALE</code>,</li> <li>• <code>AEGP_LayerStream_ROTATION</code>,</li> <li>• <code>AEGP_LayerStream_ROTATE_Z</code>,</li> <li>• <code>AEGP_LayerStream_OPACITY</code>,</li> <li>• <code>AEGP_LayerStream_AUDIO</code>,</li> <li>• <code>AEGP_LayerStream_MARKER</code>,</li> <li>• <code>AEGP_LayerStream_TIME_REMAP</code>,</li> <li>• <code>AEGP_LayerStream_ROTATE_X</code>,</li> <li>• <code>AEGP_LayerStream_ROTATE_Y</code>,</li> <li>• <code>AEGP_LayerStream_ORIENTATION</code></li> </ul> <p>Only valid for <code>AEGP_ObjectType_CAMERA</code>:</p> <ul style="list-style-type: none"> <li>• <code>AEGP_ObjectType_CAMERA</code></li> <li>• <code>AEGP_LayerStream_ZOOM</code>,</li> </ul> |
| 64.20. Stream Suite         | <ul style="list-style-type: none"> <li>• <code>AEGP_LayerStream_DEPTH_OF_FIELD</code>,</li> <li>• <code>AEGP_LayerStream_FOCUS_DISTANCE</code>,</li> <li>• <code>AEGP_LayerStream_APERTURE</code>,</li> <li>• <code>AEGP_LayerStream_BLUR_LEVEL</code>,</li> </ul>   |

## 64.21 Dynamic Streams

`AEGP_DynamicStreamSuite` accesses and manipulates paint and text streams.

Use `AEGP_GetStreamGroupingType` and `AEGP_GetDynamicStreamFlags` to identify the stream before attempting to use functions which only work on certain stream types.

Also note that, often, you can simply use *Stream Suite* calls to work with dynamic streams. On the other hand, only those functions specific to dynamic streams are in this suite.

### 64.21.1 AEGP\_DynamicStreamSuite4

| Function                     | Purpose  |
|------------------------------|--|
| AEGP_GetNewStreamRefForLayer | Retrieves the AEGP_StreamRefH corresponding to the layer. This function is used to initiate a recursive walk of the layer's streams.<br><br><pre>AEGP_GetNewStreamRefForLayer (     AEGP_PluginID    aegp_plugin_id,     AEGP_LayerH      layerH,     AEGP_StreamRefH *streamPH);</pre>  |
| AEGP_GetNewStreamRefForMask  | Retrieves the AEGP_StreamRefH corresponding to the mask.<br><br><pre>AEGP_GetNewStreamRefForMask (     AEGP_PluginID    aegp_plugin_id,     AEGP_MaskRefH    maskH,     AEGP_StreamRefH *streamPH);</pre>  |
| AEGP_GetStreamDepth          | Retrieves the number of sub-streams associated with the given AEGP_StreamRefH. The initial layer has a depth of 0.<br><br><pre>AEGP_GetStreamDepth (     AEGP_StreamRefH streamH,     A_long           *depthPL);</pre>  |
| AEGP_GetStreamGroupingType   | Retrieves the grouping type for the given AEGP_StreamRefH.<br><br><pre>AEGP_GetStreamGroupingType (     AEGP_StreamRefH    streamH,     AEGP_StreamGroupingType *group_typeP);</pre> <p>AEGP_StreamGroupingType will be one of the following:</p> <ul style="list-style-type: none"> <li>• AEGP_StreamGroupingType_NONE</li> <li>• AEGP_StreamGroupingType_LEAF</li> <li>• AEGP_StreamGroupingType_NAMED_GROUP</li> <li>• AEGP_StreamGroupingType_INDEXED_GROUP</li> </ul>   |
| AEGP_GetNumStreamsInGroup    | Retrieves the number of streams associated with the given AEGP_StreamRefH. This function will return an error if called with an AEGP_StreamRefH with type AEGP_StreamGroupingType_LEAF.<br><br><pre>AEGP_GetNumStreamsInGroup (     AEGP_StreamRefH streamH,     A_long           *num_streamsPL);</pre>   |
| AEGP_GetDynamicStreamFlags   | Retrieves the flags for a given AEGP_StreamRefH.<br><br><pre>AEGP_GetDynamicStreamFlags (     AEGP_StreamRefH    streamH,     AEGP_DynStreamFlags *flagsP);</pre> <p>AEGP_DynStreamFlags will be one of the following:</p> <ul style="list-style-type: none"> <li>• AEGP_DynStreamFlag_ACTIVE_EYEBALL means that the stream is available for reading and writing.</li> <li>• AEGP_DynStreamFlag_HIDDEN means that, while the stream is set to be visible, it will not currently be visible in the UI.</li> <li>• AEGP_DynStreamFlag_DISABLED means that the stream is not currently visible in the UI. A read-only flag. Indicates whether the AEGP_StreamRefH is owned, set in the</li> </ul> |

## 64.22 Working With Keyframes

Keyframes make After Effects what it is. AEGPs (and... sssh, don't tell anyone... effects) can use this suite to add, manipulate and remove keyframes from any keyframe-able stream.

## 64.22.1 AEGP\_KeyframeSuite3

| Function                             | Purpose   |
|--------------------------------------|---|
| AEGP_GetStreamNumKFs                 | Retrieves the number of keyframes on the given stream. Returns AEGP_NumKF_NO_DATA if the stream is not keyframe-able. Also, note that a stream without keyframes isn't necessarily constant; it can be altered by expressions.<br><br><pre>AEGP_GetStreamNumKFs (   AEGP_StreamRefH  streamH,   A_long           *num_kfsPL);</pre>   |
| AEGP_GetKeyframeTime                 | Retrieves the time of the specified keyframe.<br><br><pre>AEGP_GetKeyframeTime (   AEGP_StreamRefH  streamH,   AEGP_KeyframeIndex  index,   AEGP_LTimeMode   time_mode,   A_Time           *timePT);</pre>  |
| AEGP_InsertKeyframe                  | Adds a keyframe to the specified stream (at the specified composition or layer time). Returns the new keyframe's index. All indexes greater than the new index are now invalid (but you knew that). If there is already a keyframe at that time, the values will be updated.<br><br><pre>AEGP_InsertKeyframe (   AEGP_StreamRefH  streamH,   AEGP_LTimeMode   time_mode,   const A_Time     *timePT,   AEGP_KeyframeIndex *key_indexP);</pre> |
| AEGP_DeleteKeyframe                  | Deletes the specified keyframe.<br><br><pre>AEGP_DeleteKeyframe (   AEGP_StreamRefH  streamH,   AEGP_KeyframeIndex  key_index);</pre>   |
| AEGP_GetNewKeyframeValue             | Creates and populates an AEGP_StreamValue2 for the stream's value at the time of the keyframe. The returned AEGP_StreamValue2 must be disposed of using AEGP_DisposeStreamValue.<br><br><pre>AEGP_GetNewKeyframeValue (   AEGP_PluginID     plugin_id,   AEGP_StreamRefH   streamH,   AEGP_KeyframeIndex  key_index,   AEGP_StreamValue2 *valueP);</pre>  |
| AEGP_SetKeyframeValue                | Sets the stream's value at the time of the keyframe.<br><br><pre>AEGP_SetKeyframeValue (   AEGP_StreamRefH   streamH,   AEGP_KeyframeIndex  index,   const AEGP_StreamValue2 *valP);</pre>  |
| AEGP_GetStreamValueDimensionality    | Retrieves the dimensionality of the stream's value.<br><br><pre>AEGP_GetStreamValueDimensionality (   AEGP_StreamRefH  streamH,   A_short          *value_dimPS);</pre>   |
| AEGP_GetStreamTemporalDimensionality | Retrieves the temporal dimensionality of the stream.  |

## 64.23 Adding Multiple Keyframes

Each time you call `AEGP_InsertKeyframe()`, the entire stream is added to the undo stack.

If you're adding one or two keyframes, this isn't a problem. However, if you're writing a keyframer, you'll want to do things the *right* way.

Before you begin adding keyframes, call the (very-appropriately-named) `AEGP_StartAddKeyframes`, passing it an opaque `AEGP_AddKeyframesInfoH`.

For each keyframe to add, call `AEGP_AddKeyframes` to set the time to be used (and get the newly-added keyframe's index), then `AEGP_SetAddKeyframe` to specify the value to be used.

Once you're finished, call `AEGP_EndAddKeyframes` to let know After Effects know it's time to add the changed parameter stream to the undo stack.

---

## 64.24 Marker Streams

`AEGP_MarkerSuite` allows for direct manipulation of marker data.

## 64.24.1 AEGP\_MarkerSuite2

| Function                 | Purpose  |
|--------------------------|--|
| AEGP_NewMarker           | Creates a new marker.<br><pre>AEGP_NewMarker (   AEGP_MarkerValP  *markerPP);</pre>  |
| AEGP_DisposeMarker       | Disposes of a marker.<br><pre>AEGP_DisposeMarker (   AEGP_MarkerValP  markerP);</pre>  |
| AEGP_DuplicateMarker     | Duplicates a marker (didn't see <i>that</i> one coming, eh?).<br><pre>AEGP_DuplicateMarker (   AEGP_MarkerValP  markerP,   AEGP_MarkerValP  *new_markerP);</pre>   |
| AEGP_SetMarkerFlag       | Sets a marker flag's value.<br><pre>AEGP_SetMarkerFlag (   AEGP_MarkerValP      markerP,   AEGP_MarkerFlagType  flagType,   A_Boolean             valueB);</pre> <p>Currently, AEGP_MarkerFlagType is one of the following:</p> <ul style="list-style-type: none"> <li>• AEGP_MarkerFlag_NONE</li> <li>• AEGP_MarkerFlag_NAVIGATION</li> </ul> |
| AEGP_GetMarkerFlag       | Gets the value (see above) of a given AEGP_MarkerFlagType.<br><pre>AEGP_GetMarkerFlag (   AEGP_ConstMarkerValP markerP,   AEGP_MarkerFlagType  flagType   A_Boolean             *valueBP);</pre>   |
| AEGP_GetMarkerString     | Retrieves the UTF-16, NULL-terminated string located in the specified marker field. Must be disposed of by caller using AEGP_FreeMemHandle.<br><pre>AEGP_GetMarkerString (   AEGP_PluginID      id,   AEGP_ConstMarkerValP markerP,   AEGP_MarkerStringType strType,   AEGP_MemHandle     *unicodePH);</pre>                                   |
| AEGP_SetMarkerString     | Sets the specified field of a marker to the provided text.<br><pre>AEGP_SetMarkerString (   AEGP_MarkerValP      markerP,   AEGP_MarkerStringType strType,   const A_u_short      *unicodeP,   A_long               lengthL);</pre>  |
| AEGP_CountCuePointParams | Returns the number of cue point parameters.<br><pre>AEGP_CountCuePointParams (   AEGP_ConstMarkerValP markerP,   A_long               *paramsLP);</pre>  |
| AEGP_GetIndCuePointParam | Returns the cue point param at the specified index (which must be between 0 and (cue point params - 1)). Returned as a UTF-16, NULL-terminated string, and must be disposed of by caller using AEGP_FreeMemHandle.<br><pre>AEGP_GetIndCuePointParam (</pre>  |

## 64.25 Mask Management

Access, manipulate, and delete a layer's masks.

## 64.25.1 AEGP\_MaskSuite6

| Function                      | Purpose   |
|-------------------------------|---|
| AEGP_GetLayerNumMasks         | Counts the masks applied to a layer,<br><br><pre>AEGP_GetLayerNumMasks (     AEGP_LayerH  aegp_layerH,     A_long       *num_masksPL);</pre>  |
| AEGP_GetLayerMaskByIndex      | Given a layer handle and mask index, returns a pointer to the mask handle. You must destroy the mask handle by using AEGP_DisposeMask().<br><br><pre>AEGP_GetLayerMaskByIndex (     AEGP_LayerH  aegp_layerH,     A_long       mask_indexL,     AEGP_MaskRefH *maskPH);</pre>   |
| AEGP_DisposeMask              | Dispose of a mask handle.<br><br><pre>AEGP_DisposeMask (     AEGP_MaskRefH maskH);</pre>  |
| AEGP_GetMaskInvert            | Given a mask handle, determines if the mask is inverted or not.<br><br><pre>AEGP_GetMaskInvert (     AEGP_MaskRefH maskH,     A_Boolean     *invertPB);</pre>   |
| AEGP_SetMaskInvert            | Sets the inversion state of a mask.<br><br><pre>AEGP_SetMaskInvert (     AEGP_MaskRefH mask_refH,     A_Boolean     invertB);</pre>   |
| AEGP_GetMaskMode              | Given a mask handle, returns the current mode of the mask.<br>PF_MaskMode_NONE does nothing,<br>PF_MaskMode_ADD is the default behavior. <ul style="list-style-type: none"> <li>• PF_MaskMode_NONE</li> <li>• PF_MaskMode_ADD,</li> <li>• PF_MaskMode_SUBTRACT,</li> <li>• PF_MaskMode_INTERSECT,</li> <li>• PF_MaskMode_LIGHTEN,</li> <li>• PF_MaskMode_DARKEN,</li> <li>• PF_MaskMode_DIFFERENCE,</li> </ul> <pre>AEGP_GetMaskMode (     AEGP_MaskRefH maskH,     PF_MaskMode  *modeP);</pre> |
| AEGP_SetMaskMode              | Sets the mode of the given mask.<br><br><pre>AEGP_SetMaskMode (     AEGP_MaskRefH maskH,     PF_MaskMode  mode);</pre>  |
| AEGP_GetMaskMotionBlurState   | Retrieves the motion blur setting for the given mask.<br><br><pre>AEGP_GetMaskMotionBlurState (     AEGP_MaskRefH  mask_refH,     AEGP_MaskMBlur *blur_stateP);</pre> AEGP_MaskMBlur will be one of the following:  |
| <b>64.25. Mask Management</b> | <ul style="list-style-type: none"> <li>• AEGP_MaskMBlur_SAME_AS_LAYER</li> <li>• AEGP_MaskMBlur_OFF</li> <li>• AEGP_MaskMBlur_ON</li> </ul>   |

## 64.26 Mask Outlines

The Mask Suite above tells plug-ins about the masks on a layer, but not about the details of those masks.

This is because processing is required on After Effects' part to access the information; the information isn't just lying around.

Plug-ins access that information using this Mask Outline Suite.

## 64.26.1 AEGP\_MaskOutlineSuite3

| Function                       | Purpose   |
|--------------------------------|---|
| AEGP_IsMaskOutlineOpen         | <p>Given an mask outline pointer (obtainable through the <i>Stream Suite</i>), determines if the mask path is open or closed.</p> <pre>AEGP_IsMaskOutlineOpen(   AEGP_MaskOutlineVal *mask_outlineP,   A_Boolean            *openPB);</pre>   |
| AEGP_SetMaskOutlineOpen        | <p>Sets the open state of the given mask outline.</p> <pre>AEGP_SetMaskOutlineOpen(   AEGP_MaskOutlineValH mask_outlineH,   A_Boolean            openB);</pre>  |
| AEGP_GetMaskOutlineNumSegments | <p>Given a mask outline pointer, returns the number of segments in the path. num_segmentsPL is the total number of segments [0...N-1].</p> <pre>AEGP_GetMaskOutlineNumSegments(   AEGP_MaskOutlineVal *mask_outlineP,   A_long              *num_segmentsPL);</pre>   |
| AEGP_GetMaskOutlineVertexInfo  | <p>Given a mask outline pointer and a point between 0 and the total number of segments. For closed mask paths, vertex[0] is the same as vertex[num_segments].</p> <pre>AEGP_GetMaskOutlineVertexInfo(   AEGP_MaskOutlineVal *mask_outlineP,   A_long              which_pointL,   AEGP_MaskVertex    *vertexP);</pre>   |
| AEGP_SetMaskOutlineVertexInfo  | <p>Sets the vertex information for a given index. Setting vertex 0 is special; its in tangent will actually set the out tangent of the last vertex in the outline. Of course, which_pointL must be valid for the mask outline, or the function will return an error.</p> <pre>AEGP_SetMaskOutlineVertexInfo(   AEGP_MaskOutlineValH mask_outlineH,   AEGP_VertexIndex    which_pointL,   AEGP_MaskVertex     *vertexP);</pre> |
| AEGP_CreateVertex              | <p>Creates a vertex at index position. All vertices which formerly had an AEGP_VertexIndex of position or greater will have their indices incremented by one.</p> <pre>AEGP_CreateVertex(   AEGP_MaskOutlineValH mask_outlineH,   AEGP_VertexIndex    position);</pre> <p><b>NOTE:</b> All masks must have at least one vertex.</p>   |
| AEGP_DeleteVertex              | <p>Removes a vertex from a mask.</p> <pre>AEGP_DeleteVertex(   AEGP_MaskOutlineValH mask_outlineH,   AEGP_VertexIndex    index);</pre>  |
| AEGP_GetMaskOutlineNumFeathers | <p>New in CS6.</p> <pre>AEGP_GetMaskOutlineNumFeathers(   AEGP_MaskOutlineValH mask_outlineH,   A_long              *num_feathersPL);</pre>   |
| AEGP_GetMaskOutlineFeatherInfo | <p>New in CS6.</p> <pre>AEGP_GetMaskOutlineFeatherInfo(   AEGP_MaskOutlineValH mask_outlineH,   AEGP_FeatherIndex    which_featherL,   AEGP_FeatherInfo     *featherInfoP);</pre>   |

## 64.27 Mask Feathering

New for CS6, masks can be feathered.

AEGP\_MaskFeather is defined as follows:

```
typedef struct {
    A_long          segment;           // mask segment where feather is
    PF_FpLong       segment_sF;       // 0-1: feather location on segment
    PF_FpLong       radiusF;          // negative value allowed if type == AEGP_
    ↪MaskFeatherType_INNER
    PF_FpShort      ui_corner_angleF; // 0-1: angle of UI handle on corners
    PF_FpShort      tensionF;         // 0-1: tension of boundary at feather pt
    AEGP_MaskFeatherInterp interp;
    AEGP_MaskFeatherType type;
} AEGP_MaskFeather;
```

AEGP\_MaskFeatherInterp is either AEGP\_MaskFeatherInterp\_NORMAL or AEGP\_MaskFeatherInterp\_HOLD\_CW.

AEGP\_MaskFeatherType is either AEGP\_MaskFeatherType\_OUTER or AEGP\_MaskFeatherType\_INNER.

This suite enables AEGPs to get and set the text associated with text layers.

**Note:** to get started, retrieve an AEGP\_TextDocumentH by calling AEGP\_GetLayerStreamValue, above, and passing AEGP\_StreamType\_TEXT\_DOCUMENT as the AEGP\_StreamType.

## 64.28 Working With Text Layers

This suite enables AEGPs to get and set the text associated with text layers.

## 64.28.1 AEGP\_TextDocumentSuite1

| Function        | Purpose   |
|-----------------|---|
| AEGP_GetNewText | <p>Retrieves the UTF-16, NULL-terminated string used in the AEGP_TextDocumentH.</p> <p><b>Note:</b> After Effects will allocate the AEGP_MemHandle; your plug-in must dispose of it when done using AEGP_FreeMemHandle.</p> <pre>AEGP_GetNewText (     AEGP_PluginID      id,     AEGP_TextDocumentH text_doch,     AEGP_MemHandle     *unicodePH);</pre> |
| AEGP_SetText    | <p>Specifies the text to be used by the AEGP_TextDocumentH.</p> <pre>AEGP_SetText (     AEGP_TextDocumentH text_doch,     const A_u_short     *unicodePS,     long                 lengthL);</pre>  |

## 64.29 Working With Text Outlines

The AEGP\_TextLayerSuite provides access to the actual outlines of the text used by text layers.

Once you have a path, you can manipulate it with *PF\_PathQuerySuite1* and *PF\_PathDataSuite*.

## 64.29.1 AEGP\_TextLayerSuite1

| Function                   | Purpose  |
|----------------------------|--|
| AEGP_GetNewTextOutlines    | <p>Allocates and returns a handle to the AEGP_TextOutlinesHs associated with the specified layer. outlinesPH will be NULL if there are no AEGP_TextOutlinesHs associated with layerH (in other words, if it's not a text layer).</p> <pre>AEGP_GetNewTextOutlines (   AEGP_LayerH          layerH,   const A_Time         *layer_timePT,   AEGP_TextOutlinesH  *outlinesPH);</pre> |
| AEGP_DisposeTextOutlines   | <p>Dispose of those outlines we allocated on your behalf!</p> <pre>AEGP_DisposeTextOutlines (   AEGP_TextOutlinesH  outlinesH);</pre>  |
| AEGP_GetNumTextOutlines    | <p>Retrieves the number of text outlines for the layer.</p> <pre>AEGP_GetNumTextOutlines (   AEGP_TextOutlinesH  outlinesH,   A_long               *num_otlnsPL);</pre>  |
| AEGP_GetIndexedTextOutline | <p>Returns a PF_PathOutlinePtr for the specified text outline.</p> <pre>AEGP_GetIndexedTextOutline (   AEGP_TextOutlinesH  outlinesH,   A_long               path_indexL,   PF_PathOutlinePtr   *pathPP);</pre>  |

## 64.30 Utility Functions

The Utility suite supplies error message handling, AEGP version checking and access to the undo stack.

Everything you need to keep After Effects and your plug-in tidy.

### 64.30.1 AEGP\_UtilitySuite6

| Function        | Purpose  |
|-----------------|--|
| AEGP_ReportInfo | <p>Displays dialog with name of the AEGP followed by the string passed.</p> <pre>AEGP_ReportInfo (   AEGP_PluginID  aegp_plugin_id,   const A_char   *info_stringZ);</pre> |

Continued on next page

Table 5 – continued from previous page

| Function                  | Purpose  |
|---------------------------|--|
| AEGP_ReportInfoUnicode    | New in CC. Displays dialog with name of the AEGP followed by the unicode string passed.<br><br><pre>AEGP_ReportInfoUnicode (   AEGP_PluginID    aegp_plugin_id,   const A_UTF16Char *info_stringP);</pre>  |
| AEGP_GetDriverSpecVersion | Returns version of AEGPDriver plug-in (use to determine supported features).<br><br><pre>AEGP_GetDriverSpecVersion (   A_short *major_versionPS,   A_short *minor_versionPS);</pre>  |
| AEGP_StartQuietErrors     | Silences errors. Must be balanced with AEGP_EndQuietErrors. The AEGP_ErrReportState is an opaque structure private to After Effects.<br><br><pre>AEGP_StartQuietErrors (   AEGP_ErrReportState *err_stateP);</pre>   |
| AEGP_EndQuietErrors       | Re-enables errors.<br><br><pre>AEGP_EndQuietErrors (   AEGP_ErrReportState *err_stateP)</pre>  |
| AEGP_StartUndoGroup       | Add action(s) to the undo queue. The user may undo any actions between this and AEGP_EndUndoGroup(). The undo_nameZ will appear in the edit menu.<br><br><pre>AEGP_StartUndoGroup (   const A_char *undo_nameZ);</pre>   |
| AEGP_EndUndoGroup         | Ends the undo list.<br><br><pre>AEGP_EndUndoGroup ();</pre>  |
| AEGP_RegisterWithAEGP     | Returns an AEGP_PluginID, which effect plug-ins can then use in calls to many functions throughout the AEGP API. Effects should only call this function once, during PF_Cmd_GLOBAL_SETUP, and save the AEGP_PluginID for later use. The first parameter can be any value, and the second parameter should be the plug-in's match name.<br><br><pre>AEGP_RegisterWithAEGP (   AEGP_GlobalRefcon global_refcon,   const A_char      *plugin_nameZ,   AEGP_PluginID    *plugin_id);</pre> |
| AEGP_GetMainHWND          | Retrieves After Effects' HWND; useful when displaying your own dialog on Windows. If you don't use After Effects' HWND, your modal dialog will not prevent interaction with the windows behind, and pain will ensue.<br><br><pre>AEGP_GetMainHWND (   void *main_hwnd);</pre>  |

Continued on next page

Table 5 – continued from previous page

| Function  | Purpose  |
|---|--|
| <code>AEGP_ShowHideAllFloaters</code>           | <p>Toggles whether or not floating palettes are displayed. Use this with care; users get twitchy when you unexpectedly change the UI on them.</p> <pre>AEGP_ShowHideAllFloaters(   A_Boolean include_tool_palB);</pre>         |
| <code>AEGP_PaintPalGetForeColor</code>          | <p>Retrieves the foreground color from the paint palette.</p> <pre>AEGP_PaintPalGetForeColor(   AEGP_ColorVal *fore_colorP);</pre>   |
| <code>AEGP_PaintPalGetBackColor</code>          | <p>Retrieves the background color from the paint palette.</p> <pre>AEGP_PaintPalGetBackColor(   AEGP_ColorVal *back_colorP);</pre>   |
| <code>AEGP_PaintPalSetForeColor</code>          | <p>Sets the foreground color in the paint palette.</p> <pre>AEGP_PaintPalSetForeColor(   const AEGP_ColorVal *fore_colorP);</pre>  |
| <code>AEGP_PaintPalSetBackColor</code>          | <p>Sets the background color in the paint palette.</p> <pre>AEGP_PaintPalSetBackColor(   const AEGP_ColorVal *back_colorP);</pre>  |
| <code>AEGP_CharPalGetFillColor</code>           | <p>Retrieves the fill color from the character palette.</p> <pre>AEGP_CharPalGetFillColor(   A_Boolean *is_fcolor_definedPB,   AEGP_ColorVal *fill_colorP);</pre>  |
| <code>AEGP_CharPalGetStrokeColor</code>         | <p>Retrieves the stroke color from the character palette.</p> <pre>AEGP_CharPalGetStrokeColor(   A_Boolean *is_scolor_definedPB,   AEGP_ColorVal *stroke_colorP);</pre>  |
| <code>AEGP_CharPalSetFillColor</code>           | <p>Sets the fill color in the character palette.</p> <pre>AEGP_CharPalSetFillColor(   const AEGP_ColorVal *fill_colorP);</pre>   |
| <code>AEGP_CharPalSetStrokeColor</code>         | <p>Sets the stroke color in the character palette.</p> <pre>AEGP_CharPalSetStrokeColor(   const AEGP_ColorVal *stroke_colorP);</pre>   |
| <code>AEGP_CharPalIsFillColorUIFrontmost</code> | <p>Returns whether or not the fill color is frontmost. If it isn't, the stroke color is frontmost.</p> <pre>AEGP_CharPalIsFillColorUIFrontmost(   A_Boolean *is_fcolor_selectedPB);</pre>                                      |
| <code>AEGP_ConvertFpLongToHSFRatio</code>       | <p>Returns an <code>A_Ratio</code> interpretation of the given <code>A_FpLong</code>. Useful for horizontal scale factor interpretation.</p> <pre>AEGP_ConvertFpLongToHSFRatio(   A_FpLong numberF,   A_Ratio *ratioPR);</pre> |

Continued on next page

Table 5 – continued from previous page

| Function                         | Purpose  |
|----------------------------------|--|
| AEGP_ConvertHSFRatioToFpLong     | <p>Returns an A_FpLong interpretation of the given A_Ratio. Useful for horizontal scale factor interpretation.</p> <pre>AEGP_ConvertHSFRatioToFpLong(     A_Ratio    ratioR,     A_FpLong   *numberPF);</pre>  |
| AEGP_CauseIdleRoutinesToBeCalled | <p>This routine is safe to call from threads other than the main thread. It is asynchronous and will return before the idle handler is called.</p> <p>The suite functions to get this function pointer are not thread safe; save it off in the main thread for use by the child thread.</p> <pre>AEGP_CauseIdleRoutinesToBeCalled(void);</pre> |
| AEGP_GetSuppressInteractiveUI    | <p>Returns whether After Effects is running without a user interface.</p> <pre>AEGP_GetSuppressInteractiveUI(     A_Boolean *ui_is_suppressedPB);</pre>  |
| AEGP_WriteToOSConsole            | <p>Sends a string to the OS console.</p> <pre>AEGP_WriteToOSConsole(     const A_char *textZ);</pre>   |
| AEGP_WriteToDebugLog             | <p>Writes a message to the debug log, or to the OS command line if After Effects was launched with the “-debug” option.</p> <pre>AEGP_WriteToDebugLog(     const A_char *subsystemZ,     const A_char *event_typeZ,     const A_char *infoZ);</pre>  |
| AEGP_GetLastErrorMessage         | <p>Retrieves the last error message displayed to the user, and its associated error number. Pass in the size of the character buffer to be returned.</p> <pre>AEGP_GetLastErrorMessage(     A_long   buffer_size,     A_char *error_string,     A_Err   *error_num);</pre>   |
| AEGP_IsScriptingAvailable        | <p>Returns TRUE if scripting is available to the plug-in.</p> <pre>AEGP_IsScriptingAvailable(     A_Boolean *outAvailablePB);</pre>  |

Continued on next page

Table 5 – continued from previous page

| Function                  | Purpose   |
|---------------------------|---|
| AEGP_ExecuteScript        | <p>Have After Effects execute a script. The script passed in can be in either UTF-8 or the current application encoding (if platform_encodingB is passed in as TRUE). The two out arguments are optional. The value of the last line of the script is what is passed back in outResultPH0.</p> <pre>AEGP_ExecuteScript (   AEGP_PluginID inPlugin_id,   const A_char *inScriptZ,   const A_Boolean platform_encodingB,   AEGP_MemHandle *outResultPH0,   AEGP_MemHandle *outErrStringPH0);</pre>  |
| AEGP_HostIsActivated      | <p>Returns TRUE if the user has successfully activated After Effects.</p> <pre>AEGP_HostIsActivated(   A_Boolean *is_activatedPB);</pre>  |
| AEGP_GetPluginPlatformRef | <p>On macOS, returns a CFBundleRef to your Mach-O plug-in, or NULL for a CFM plug-in. Always returns NULL on Windows (you can use an OS-specific entry point to capture your DLLInstance).</p> <pre>AEGP_GetPluginPlatformRef (   AEGP_PluginID plug_id,   void **plat_refPPV);</pre>   |
| AEGP_UpdateFontList       | <p>Rescans the system font list.</p> <pre>AEGP_UpdateFontList ();</pre>   |
| AEGP_GetPluginPaths       | <p>New in CC. Returns a particular path associated with the plug-in:</p> <ul style="list-style-type: none"> <li>• AEGP_GetPathTypes_PLUGIN - (Not Implemented) The path to the location of the plug-in itself.</li> <li>• AEGP_GetPathTypes_USER_PLUGIN -The suite specific location of user specific plug-ins.</li> <li>• AEGP_GetPathTypes_ALLUSER_PLUGIN - The suite specific location of plug-ins shared by all users.</li> <li>• AEGP_GetPathTypes_APP - The After Effects .exe or .app location. Not plug-in specific.</li> </ul> <pre>AEGP_GetPluginPaths (   AEGP_PluginID aegp_plugin_id,   AEGP_GetPathTypes path_type   AEGP_MemHandle *unicode_pathPH);</pre> |

## 64.31 Persistent Data Suite

Plug-ins have read and write access to persistent data in After Effects' preferences. AEGPs may add and manage their own persistent data using the following suite. The data entries are accessed by (section key, value key) pairs. It is recommended that plug-ins use their matchname as their section key, or as a prefix if using multiple section keys.

The available data types are `A_long`, `A_FpLong`, strings, and `void*`. `A_FpLong`s are stored with 6 decimal places of precision. There is no provision for specifying a different precision. String data supports the full 8-bit space. Only `0x00` is reserved for string ending. This makes them ideal for storing UTF-8 encoded strings, ISO 8859-1, and plain ASCII. Both section keys and value keys are of this type. For data types not represented by the simple data types provided, use data handles containing your custom data. `void*` unstructured data allows you to store any kind of data. You must pass in a size in bytes along with the data.

When calling any of the functions to retrieve the value of a key, if a given key is not found, the default value is both written to the blob and returned as the value; if no default is provided, a blank value will be written and returned.

Note that this data is stored in the application's preferences, not in the project. As of 6.5, there is no way to store opaque AEGP-generated data in an After Effects project.

After Effects can handle plug-ins which change the preferences during their application; it checks the in-RAM copy of the prefs before acting upon pref-able settings, rather than relying on the saved prefs. It's like we *planned* this, or something!

## 64.31.1 AEGP\_PersistentDateSuite4

| Function                  | Purpose  |
|---------------------------|--|
| AEGP_GetApplicationBlob   | <p>Obtains the handle to all persistent application data. Modifying this will modify the application. The AEGP_PersistentType parameter is new in CC, and should be set to one of the following:</p> <ul style="list-style-type: none"> <li>• AEGP_PersistentType_MACHINE_SPECIFIC,</li> <li>• AEGP_PersistentType_MACHINE_INDEPENDENT,</li> <li>• AEGP_PersistentType_MACHINE_INDEPENDENT_RENDER</li> <li>• AEGP_PersistentType_MACHINE_INDEPENDENT_OUTPUT</li> <li>• AEGP_PersistentType_MACHINE_INDEPENDENT_COMPOS</li> <li>• AEGP_PersistentType_MACHINE_SPECIFIC_TEXT,</li> <li>• AEGP_PersistentType_MACHINE_SPECIFIC_PAINT</li> </ul> <pre>AEGP_GetApplicationBlob (   AEGP_PersistentType  blob_type,   AEGP_PersistentBlobH *blobPH);</pre> |
| AEGP_GetNumSections       | <p>Obtains the number of sections in the application blob.</p> <pre>AEGP_GetNumSections (   AEGP_PersistentBlobH blobH,   A_long                *num_sectionPL);</pre>   |
| AEGP_GetSectionKeyByIndex | <p>Obtains the key at the given index.</p> <pre>AEGP_GetSectionKeyByIndex (   AEGP_PersistentBlobH blobH,   A_long                section_index,   A_long                max_section_size,   A_char                *section_keyZ);</pre>   |
| AEGP_DoesKeyExist         | <p>Returns whether or not a given key/value pair exists with the blob.</p> <pre>AEGP_DoesKeyExist (   AEGP_PersistentBlobH blobH,   const A_char         *section_keyZ,   const A_char         *value_keyZ,   A_Boolean            *existsPB);</pre>   |
| AEGP_GetNumKeys           | <p>Retrieves the number of value keys in the section.</p> <pre>AEGP_GetNumKeys (   AEGP_PersistentBlobH blobH,   const A_char         *section_keyZ,   A_long                *num_keysPL);</pre>   |
| AEGP_GetValueKeyByIndex   | <p>Retrieves the value of the indexed key.</p> <pre>AEGP_GetValueKeyByIndex (   AEGP_PersistentBlobH blobH,   const A_char         *section_keyZ,   A_long                key_index,   A_long                max_key_size,   A_char                *value_keyZ);</pre>   |

**Note:** For the functions below, if a given key is not found, the default value is both written to the blob and returned

as the value; if no default is provided, a blank value will be written and returned.

---

| Function                            | Purpose  |
|-------------------------------------|--|
| AEGP_GetDataHandle                  | <p>Obtains the value associated with the given section's key. ## 64.32 Color Management

We've provided a function so AEGPs can obtain information on After Effects' current color management settings.

## 64.32.1 AEGP\_ColorSettingsSuite2

| Function                               | Purpose  |
|--|--|
| AEGP_GetBlendingTables                 | Retrieves the current opaque PF_EffectBlendingTables, for use with AEGP_TransferRect.<br><br><pre>AEGP_GetBlendingTables (     PR_RenderContextH    render_     ↪contextH,     PF_EffectBlendingTables *blending_     ↪tables);</pre>  |
| AEGP_DoesViewHaveColorSpaceXform       | Returns whether there is a colorspace transform applied to the current item view.<br><br><pre>AEGP_DoesViewHaveColorSpaceXform(     AEGP_ItemViewP    viewP,     A_Boolean          *has_xformPB);</pre>   |
| AEGP_XformWorkingToViewColorSpace      | Changes the view colorspace of the source to be the working colorspace of the destination. Source and destination can be the same.<br><br><pre>AEGP_XformWorkingToViewColorSpace (     AEGP_ItemViewP    viewP,     AEGP_WorldH        srcH,     AEGP_WorldH        dstH);</pre>   |
| AEGP_GetNewWorkingSpaceColorProfile    | Retrieves the opaque current working space ICC profile. Must be disposed. The “New” in the name does not indicate that you’re making up a new profile; rather, it’s part of our function naming standard; nything with “New” in the name allocates something which the caller must dispose.<br><br><pre>AEGP_GetNewWorkingSpaceColorProfile (     AEGP_PluginID    aegp_plugin_id,     AEGP_MemHandle    *icc_profPH);</pre> |
| AEGP_GetNewColorProfileFromICCPProfile | Retrieves a new AEGP_ColorProfileP from After Effects, representing the specified ICC profile. The caller must dispose of the returned AEGP_ColorProfileP using AEGP_DisposeColorProfile().<br><br><pre>AEGP_GetNewColorProfile FromICCPProfile (     AEGP_PluginID    aegp_plugin_id,     A_long            icc_sizeL,     const void        *icc_dataPV,     AEGP_ColorProfileP *profilePP);</pre>                         |
| AEGP_GetNewICCPProfileFromColorProfile | Retrieves a new ICC profile (stored in an AEGP_MemHandle) representing the specified color profile. Returned AEGP_MemHandle must be disposed by the caller.<br><br><pre>AEGP_GetNewICCPProfile FromColorProfile (     AEGP_PluginID    plugin_id,     AEGP_ConstColorProfileP profileP,     AEGP_MemHandle    *profilePH);</pre>   |
| AEGP_GetNewColorProfileDescription     | Returns a textual description of the specified color profile. Text will be a null-terminated UTF16 string, which must be disposed by the caller.<br><br><pre>AEGP_GetNewColorProfileDescription (     AEGP_PluginID    aegp_plugin</pre>   |

## 64.33 Render Suites

Since we introduced the AEGP API, we've been asked to provide functions for retrieving rendered frames.

These function suites allows you to do just that.

First, specify what you want rendered in the *AEGP\_RenderOptionsSuite4* or *AEGP\_LayerRenderOptionsSuite1*.

Then do the rendering with *AEGP\_RenderSuite4*.

## 64.33.1 AEGP\_RenderOptionsSuite4

| Function                    | Purpose   |
|-----------------------------|---|
| AEGP_NewFromItem            | Returns the AEGP_RenderOptionsH associated with a given AEGP_ItemH. If there are no options yet specified, After Effects passes back an AEGP_RenderOptionsH with render time set to 0, time step set to the current frame duration, field render set to PF_Field_FRAME, and the depth set to the highest resolution specified within the item.<br><br><pre>AEGP_NewFromItem(   AEGP_PluginID      plugin_id,   AEGP_ItemH         itemH,   AEGP_RenderOptionsH *optionsPH);</pre> |
| AEGP_Duplicate              | Duplicates an AEGP_RenderOptionsH into copyPH.<br><br><pre>AEGP_Duplicate(   AEGP_PluginID      plugin_id,   AEGP_RenderOptionsH optionsH,   AEGP_RenderOptionsH *copyPH);</pre>  |
| AEGP_Dispose                | Deletes an AEGP_RenderOptionsH.<br><br><pre>AEGP_Dispose(   AEGP_RenderOptionsH optionsH);</pre>  |
| AEGP_SetTime                | Sets the render time of an AEGP_RenderOptionsH.<br><br><pre>AEGP_SetTime(   AEGP_RenderOptionsH optionsH,   A_Time               time);</pre>   |
| AEGP_GetTime                | Retrieves the render time of the given AEGP_RenderOptionsH.<br><br><pre>AEGP_GetTime(   AEGP_RenderOptionsH optionsH,   A_Time               *timeP);</pre>   |
| AEGP_SetTimeStep            | Specifies the time step (duration of a frame) for the referenced AEGP_RenderOptionsH.<br><br><pre>AEGP_SetTimeStep(   AEGP_RenderOptionsH optionsH,   A_Time               time_step);</pre>  |
| AEGP_GetTimeStep            | Retrieves the time step (duration of a frame) for the given AEGP_RenderOptionsH.<br><br><pre>AEGP_GetTimeStep(   AEGP_RenderOptionsH optionsH,   A_Time               *timePT);</pre>   |
| AEGP_SetFieldRender         | Specifies the field settings for the given AEGP_RenderOptionsH.<br><br><pre>AEGP_SetFieldRender(   AEGP_RenderOptionsH optionsH,   PF_Field             field_render);</pre>  |
| AEGP_GetFieldRender         | Retrieves the field settings for the given AEGP_RenderOptionsH.<br><br><pre>AEGP_GetFieldRender(   AEGP_RenderOptionsH optionsH,   PF_Field             *field_renderP);</pre>  |
| <b>64.33. Render Suites</b> | <b>AEGP_RenderOptionsH. 301</b>   |

## 64.33.2 AEGP\_LayerRenderOptionsSuite1

---

**Note:** New in 13.0

---

| Function                     | Purpose  |
|------------------------------|--|
| AEGP_NewFromLayer            | <p>Returns the AEGP_LayerRenderOptionsH associated with a given AEGP_LayerH. Render time is set to the layer's current time, time step is set to layer's frame duration, ROI to the layer's nominal bounds, and EffectsToRender to "all". optionsPH must be disposed by calling code.</p> <pre data-bbox="815 457 1432 590">AEGP_NewFromLayer (     AEGP_PluginID          plugin_id,     AEGP_LayerH            layerH,     AEGP_LayerRenderOptionsH *optionsPH);</pre>   |
| AEGP_NewFromUpstreamOfEffect | <p>Returns the AEGP_LayerRenderOptionsH from the layer associated with a given AEGP_EffectRefH. Render time is set to the layer's current time, time step is set to layer's frame duration, ROI to the layer's nominal bounds, and EffectsToRender to the index of effectH. optionsPH must be disposed by calling code.</p> <pre data-bbox="815 800 1432 932">AEGP_NewFromUpstreamOfEffect (     AEGP_PluginID          plugin_id,     AEGP_EffectRefH        effectH,     AEGP_LayerRenderOptionsH *optionsPH);</pre> |
| AEGP_Duplicate               | <p>Duplicates an AEGP_LayerRenderOptionsH into copyPH.</p> <pre data-bbox="815 1016 1432 1148">AEGP_Duplicate (     AEGP_PluginID          plugin_id,     AEGP_LayerRenderOptionsH optionsH,     AEGP_LayerRenderOptionsH *copyPH);</pre>  |

| <b>64.33. Render Suites</b>  |  |
| AEGP_SetWorldType            | <p>Specifies the AEGP_WorldType of the output of a given AEGP_LayerRenderOptionsH.</p> <pre data-bbox="815 2083 1432 2100">AEGP_SetWorldType (</pre>   |

### 64.33.3 AEGP\_RenderSuite4

| Function                                | Purpose  |
|---|--|
| <p>AEGP_RenderAndCheckoutFrame</p>      | <p>Retrieves an AEGP_FrameReceiptH (not the actual pixels) for the frame requested. Check in this receipt using AEGP_CheckinFrame to release memory. Create the AEGP_RenderOptionsH using the <i>AEGP_RenderOptionsSuite4</i>. Optionally, the AEGP can pass a function to be called by After Effects if the user cancels the current render, as well as a refcon (constant reference to opaque data) for use during that function.</p> <pre> AEGP_RenderAndCheckoutFrame (     AEGP_RenderOptionsH           ↵     ↪optionsH,     AEGP_RenderSuiteCheckForCancel  cancel_     ↪functionP0,     AEGP_CancelRefcon             cancel_     ↪function_refconP0,     AEGP_FrameReceiptH           ↵     ↪*receiptPH);                     </pre>  |
| <p>AEGP_RenderAndCheckoutLayerFrame</p> | <p>New in CC 2014. This allows frame checkout of a layer with effects applied at non-render time. This is useful for an operation that requires the frame, for example, when a button is clicked and it is acceptable to wait for a moment while it is rendering. Note: Since it is not asynchronous, it will not solve the general problem where custom UI needs to draw based on the frame. Retrieves an AEGP_FrameReceiptH (not the actual pixels) for the layer frame requested. Check in this receipt using AEGP_CheckinFrame to release memory. Create the AEGP_LayerRenderOptionsH using AEGP_NewFromUpstreamOfEffect(), in <i>AEGP_LayerRenderOptionsSuite1</i>. You can actually use AEGP_NewFromLayer() to get other layer param's layers with their effects applied. However, be careful. If you do it in your effect A, and there's an effect B on the other layer that does the same thing during rendering, you'd create an infinite loop. If you're not doing it for render purposes then it could be okay. Optionally, the AEGP can pass a function to be called by After Effects if the user cancels the current render, as well as a refcon (constant reference to opaque data) for use during that function.</p> <pre> AEGP_RenderAndCheckoutLayerFrame (     AEGP_LayerRenderOptionsH       ↵     ↪optionsH,     A_Boolean                       render_     ↪plain_layer_frameB,     AEGP_RenderSuiteCheckForCancel  cancel_     ↪functionP0,     AEGP_CancelRefcon             cancel_     ↪function_refconP0,     AEGP_FrameReceiptH           ↵     ↪*receiptPH);                     </pre> |
| <p><b>64.33. Render Suites</b></p>      | <p style="text-align: right;"><b>305</b></p>   |
| <p>AEGP_CheckinFrame</p>                | <p>Call this function as soon as your AEGP is done access-</p>   |

## 64.34 The AEGP\_World As We Know It

AEGP\_Worlds are the common format used throughout the AEGP APIs to describe frames of pixels.

### 64.34.1 AEGP\_WorldSuite3

| Function                  | Purpose   |
|---------------------------|---|
| AEGP_New                  | Returns an allocated, initialized AEGP_WorldH.<br><br><pre>AEGP_New (     AEGP_PluginID  plugin_id,     AEGP_WorldType type,     A_long         widthL,     A_long         heightL,     AEGP_WorldH   *worldPH);</pre>  |
| AEGP_Dispose              | Disposes of an AEGP_WorldH. Use this on every world you allocate.<br><br><pre>AEGP_Dispose (     AEGP_WorldH worldH);</pre>   |
| AEGP_GetType              | Returns the type of a given AEGP_WorldH.<br><br><pre>AEGP_GetType (     AEGP_WorldH worldH,     AEGP_WorldType **typeP);</pre> <p>AEGP_WorldType will be one of the following:</p> <ul style="list-style-type: none"> <li>• AEGP_WorldType_8,</li> <li>• AEGP_WorldType_16,</li> <li>• AEGP_WorldType_32</li> </ul> |
| AEGP_GetSize              | Returns the width and height of the given AEGP_WorldH.<br><br><pre>AEGP_GetSize (     AEGP_WorldH worldH,     A_long      *widthPL,     A_long      *heightPL);</pre>   |
| AEGP_GetRowBytes          | Returns the rowbytes for the given AEGP_WorldH.<br><br><pre>AEGP_GetRowBytes (     AEGP_WorldH worldH,     A_u_long     *row_bytesPL);</pre>  |
| AEGP_GetBaseAddr8         | Returns the base address of the AEGP_WorldH for use in pixel iteration functions. Will return an error if used on a non-8bpc world.<br><br><pre>AEGP_GetBaseAddr8 (     AEGP_WorldH worldH,     PF_Pixel8    **base_addrP);</pre>   |
| AEGP_GetBaseAddr16        | Returns the base address of the AEGP_WorldH for use in pixel iteration functions. Will return an error if used on a non-16bpc world.<br><br><pre>AEGP_GetBaseAddr16 (     AEGP_WorldH worldH,     PF_Pixel16    **base_addrP);</pre>  |
| AEGP_GetBaseAddr32        | Returns the base address of the AEGP_WorldH for use in pixel iteration functions. Will return an error if used on a non-32bpc world.<br><br><pre>AEGP_GetBaseAddr32 (     AEGP_WorldH worldH,     PF_PixelFloat **base_addrP);</pre>  |
| <b>308</b>                | <b>Chapter 64. AEGP Suites</b>  |
| AEGP_FillOutPFEffectWorld | Populates and returns a PF_EffectWorld representing the given AEGP_WorldH, for use with numerous pixel  |

## 64.35 Track Mattes and Transform Functions

Use the `AEGP_CompositeSuite` to copy pixel worlds, operate on track mattes, and apply transfer functions.

## 64.35.1 AEGP\_CompositeSuite2

| Function   | Purpose  |
|--|--|
| AEGP_ClearAlphaExceptRect                          | For the given PF_EffectWorld, sets the alpha to fully transparent except for the specified rectangle.<br><br><pre>AEGP_ClearAlphaExceptRect (   A_Rect          *clipped_dst_rectPR,   PF_EffectWorld *dstP);</pre>  |
| AEGP_PrepTrackMatte                                | Mattes the pixels in a PF_EffectWorld with the PF_Pixel described in src_masks, putting the output into an array of pixels dst_mask.<br>NOTE: Unlike most of the other pixel mangling functions provided by After Effects, this one doesn't take PF_EffectWorld arguments; rather, you can simply pass the data pointer from within the PF_EffectWorld. This can be confusing, but as a bonus, the function pads output appropriately so that num_pix pixels are always output.<br><br><pre>AEGP_PrepTrackMatte (   A_long          num_pix,   A_Boolean       deepB,   const PF_Pixel  *src_mask,   PF_MaskFlags    mask_flags,   PF_Pixel        *dst_mask);</pre> |
| AEGP_TransferRect                                  | Blends two PF_EffectWorlds using a transfer mode, with an optional mask. Pass NULL for the blend_tablesP0 parameter to perform blending in the current working color space.<br><br><pre>AEGP_TransferRect (   PF_Quality          quality,   PF_ModeFlags        m_flags,   PF_Field            field,   const A_Rect        *src_rec,   const PF_EffectWorld *src_world,   const PF_CompositeMode *comp_mode,   PF_EffectBlendingTables blend_   ↪tablesP0,   const PF_MaskWorld   *mask_world0,   A_long              dest_x,   A_long              dest_y,   PF_EffectWorld      *dst_world);</pre>   |
| AEGP_CopyBits_LQ                                   | Copies a rectangle of pixels (pass a NULL rectangle to get all pixels) from one PF_EffectWorld to another, at low quality.<br><br><pre>AEGP_CopyBits_LQ (   PF_EffectWorld *src_worldP,   A_Rect        *src_r,   A_Rect        *dst_r,   PF_EffectWorld *dst_worldP);</pre>   |
| AEGP_CopyBits_HQ_Straight                          | Copies a rectangle of pixels (pass a NULL rectangle to get all pixels) from one PF_EffectWorld to another, at high quality, with a straight alpha channel.   |
| <b>64.35. Track Mattes and Transform Functions</b> | <pre>AEGP_CopyBits_HQ_Straight (   PF_EffectWorld *src,   A_Rect        *src_r,   A_Rect        *dst_r,   PF_EffectWorld *dst);</pre>  |

## 64.36 Work With Audio

`AEGP_SoundDataSuite` allows AEGPs to obtain and manipulate the audio associated with compositions and footage items.

Audio-only items may be added to the render queue using `AEGP_RenderNewItemSoundData()`.

### 64.36.1 AEGP\_SoundDataSuite1

| Function                                 | Purpose   |
|--|---|
| <code>AEGP_NewSoundData</code>           | <p>Creates a new <code>AEGP_SoundDataH</code>, of which the plug-in must dispose.</p> <pre>AEGP_NewSoundData (     const AEGP_SoundDataFormat *formatP,     AEGP_SoundDataH             *new_     ↳dataPH);</pre> |
| <code>AEGP_DisposeSoundData</code>       | <p>Frees an <code>AEGP_SoundDataH</code>.</p> <pre>AEGP_DisposeSoundData (     AEGP_SoundDataH sound_dataH);</pre>  |
| <code>AEGP_GetSoundDataFormat</code>     | <p>Obtains information about the format of a given <code>AEGP_SoundDataH</code>.</p> <pre>AEGP_GetSoundDataFormat (     AEGP_SoundDataH     soundH,     AEGP_SoundDataFormat *formatP);</pre>                     |
| <code>AEGP_LockSoundDataSamples</code>   | <p>Locks the <code>AEGP_SoundDataH</code> in memory.</p> <pre>AEGP_LockSoundDataSamples (     AEGP_SoundDataH soundH,     void                **samples);</pre>   |
| <code>AEGP_UnlockSoundDataSamples</code> | <p>Unlocks an <code>AEGP_SoundDataH</code>.</p> <pre>AEGP_UnlockSoundDataSamples (     AEGP_SoundDataH soundH);</pre>   |
| <code>AEGP_GetNumSamples</code>          | <p>Obtains the number of samples in the given <code>AEGP_SoundDataH</code>.</p> <pre>AEGP_GetNumSamples (     AEGP_SoundDataH soundH,     A_long           *numsamplesPL);</pre>                                  |

## 64.37 Audio Settings

Audio render settings are represented using the `AEGP_SoundDataFormat`.

```

struct AEGP_SoundDataFormat {
    A_FpLong      sample_rateF;
    AEGP_SoundEncoding  encoding;
    A_long        bytes_per_sampleL;
    A_long        num_channelsL; // 1 for mono, 2 for stereo
} AEGP_SoundDataFormat;

```

bytes\_per\_sampleL is always either 1, 2, or 4, and is ignored if float encoding is specified.

AEGP\_SoundEncoding is one of the following:

- AEGP\_SoundEncoding\_UNSIGNED\_PCM
- AEGP\_SoundEncoding\_SIGNED\_PCM
- AEGP\_SoundEncoding\_FLOAT

## 64.38 Render Queue Suite

This suite allows AEGPs to add items the to render queue (using default options), and control the basic state of the render queue.

### 64.38.1 AEGP\_RenderQueueSuite1

| Function                  | Purpose   |
|---------------------------|---|
| AEGP_AddCompToRenderQueue | <p>Adds a composition to the render queue, using default options.</p> <pre> AEGP_AddCompToRenderQueue (     AEGP_CompH      compH,     <b>const</b> A_char*   pathZ); </pre>  |
| AEGP_SetRenderQueueState  | <p>Sets the render queue to one of three valid states. It is not possible to go from stopped to paused.</p> <pre> AEGP_SetRenderQueueState (     AEGP_RenderQueueState  state); </pre> <ul style="list-style-type: none"> <li>• AEGP_RenderQueueState_STOPPED</li> <li>• AEGP_RenderQueueState_PAUSED</li> <li>• AEGP_RenderQueueState_RENDERING</li> </ul> |
| AEGP_GetRenderQueueState  | <p>Obtains the current render queue state.</p> <pre> AEGP_GetRenderQueueState (     AEGP_RenderQueueState  *stateP); </pre>   |

## 64.39 Render Queue Item Suite

Manipulate all aspects of render queue items using this suite.

## 64.39.1 AEGP\_RQItemSuite4

| Function                                  | Purpose   |
|---|---|
| AEGP_GetNumRQItems                        | Returns the number of items currently in the render queue.<br><br>AEGP_GetNumRQItems (<br>A_long    *num_itemsPL);  |
| AEGP_GetRQItemByIndex                     | Returns an AEGP_RQItemRefH referencing the index'd item.<br><br>AEGP_GetRQItemByIndex (<br>A_long            rq_item_index,<br>AEGP_RQItemRefH *rq_item_refPH);   |
| AEGP_GetNextRQItem                        | Returns the next AEGP_RQItemRefH, for iteration purposes. To get the first AEGP_RQItemRefH, pass RQ_ITEM_INDEX_NONE for the current_rq_itemH.<br><br>AEGP_GetNextRQItem (<br>AEGP_RQItemRefH current_rq_itemH,<br>AEGP_RQItemRefH *next_rq_itemPH);   |
| AEGP_GetNumOutputModulesForRQItem         | Returns the number of output modules applied to the given AEGP_RQItemRefH.<br><br>AEGP_GetNumOutputModulesForRQItem (<br>AEGP_RQItemRefH rq_itemH,<br>A_long            *num_outmodsPL);  |
| AEGP_GetRenderState                       | Returns TRUE if the AEGP_RQItemRefH is set to render (once the user clicks the Render button).<br><br>AEGP_GetRenderState (<br>AEGP_RQItemRefH rq_itemH,<br>A_Boolean        *will_renderPB);   |
| AEGP_SetRenderState                       | Controls whether or not the AEGP_RQItemRefH will render when the user next clicks the Render button. Returns an error if called during rendering.<br>This function will return: <ul style="list-style-type: none"> <li>• Err_PARAMETER if you try to call while AEGP_RenderQueueState isn't AEGP_RenderQueueState_STOPPED,</li> <li>• Err_RANGE if you pass a status that is illegal in any case, and</li> <li>• Err_PARAMETER if you try to pass a status that doesn't make sense (like trying to queue something for which there's no output path)</li> </ul><br>AEGP_SetRenderState (<br>AEGP_RQItemRefH rq_itemH,<br>A_Boolean        renderB); |
| AEGP_GetStartedTime                       | Returns the time (in seconds, since 1904) that rendering began.<br><br>AEGP_GetStartedTime (<br>AEGP_RQItemRefH rq_itemH,<br>A_Time            *started_timePT);  |
| <b>64.39.1 AEGP_RenderQueueItem Suite</b> | Returns the time elapsed since rendering began. <b>315</b><br><br>AEGP_GetElapsedTime (<br>AEGP_RQItemRefH rq_itemH,<br>A_Time            *render_timePT);  |

## 64.40 Render Queue Monitor Suite

New in CS6. This suite provides all the info a render queue manager needs to figure out what is happening at any point in a render.

## 64.40.1 AEGP\_RenderQueueMonitorSuite1

| Function              | Purpose   |
|-----------------------|---|
| AEGP_RegisterListener | <p>Register a set of plug-in-defined functions to be called by the render queue. Use the refcon to pass in data that you want to use later on when your plug-in-defined functions in AEGP_RQM_FunctionBlock1 are called later. It may be set it to NULL if you don't need it.</p> <pre> AEGP_RegisterListener (     AEGP_PluginID                aegp_ ↪plugin_id,     AEGP_RQM_Refcon              aegp_ ↪refconP,     const AEGP_RQM_FunctionBlock1 *fcn_ ↪blockP); </pre> <p>The AEGP_RQM_FunctionBlock1 is defined as follows:</p> <pre> struct _AEGP_RQM_FunctionBlock1 {     A_Err (*AEGP_RQM_RenderJobStarted) (         AEGP_RQM_BasicData *basic_dataP,         AEGP_RQM_SessionId  jobid);      A_Err (*AEGP_RQM_RenderJobEnded) (         AEGP_RQM_BasicData *basic_dataP,         AEGP_RQM_SessionId  jobid);      A_Err (*AEGP_RQM_RenderJobItemStarted) (         AEGP_RQM_BasicData *basic_dataP,         AEGP_RQM_SessionId  jobid,         AEGP_RQM_ItemId     itemid);      A_Err (*AEGP_RQM_RenderJobItemUpdated) (         AEGP_RQM_BasicData *basic_dataP,         AEGP_RQM_SessionId  jobid,         AEGP_RQM_ItemId     itemid,         AEGP_RQM_FrameId    frameid);      A_Err (*AEGP_RQM_RenderJobItemEnded) (         AEGP_RQM_BasicData *basic_ ↪dataP,         AEGP_RQM_SessionId  jobid,         AEGP_RQM_ItemId     itemid,         AEGP_RQM_FinishedStatus  fstatus);      A_Err (*AEGP_RQM_ ↪RenderJobItemReportLog) (         AEGP_RQM_BasicData *basic_dataP,         AEGP_RQM_SessionId  jobid,         AEGP_RQM_ItemId     itemid,         A_Boolean            isError,         AEGP_MemHandle        logbuf); } AEGP_RQM_FunctionBlock1; </pre> <p>AEGP_RQM_FinishedStatus will be one of the following:</p> <ul style="list-style-type: none"> <li>• AEGP_RQM_FinishedStatus_UNKNOWN,</li> <li>• AEGP_RQM_FinishedStatus_SUCCEEDED,</li> <li>• AEGP_RQM_FinishedStatus_ABORTED,</li> <li>• AEGP_RQM_FinishedStatus_ERRED</li> </ul> |
| 318                   | <p style="text-align: right;">Chapter 64. AEGP Suites</p> <p>The AEGP_RQM_BasicData is defined below.</p> <pre> struct _AEGP_RQM_BasicData {     const struct SPBasicSuite *pica_basicP; </pre>   |

## 64.41 Output Module Suite

Every item in the render queue has at least one output module specified.

Use this suite to query and control all aspects of the output modules attached to a given render item.

You may also add and remove output modules.

Factoid: For each frame rendered for a given render item, the list of output modules is traversed. So, for frame 0, output module 0, then 1, then 2 are called.

## 64.41.1 AEGP\_OutputModuleSuite4

| Function                          | Purpose   |
|-----------------------------------|---|
| AEGP_GetOutputModuleByIndex       | Retrieves the indexed output module.<br>NOTE: AEGP_OutputModuleRefH is an opaque data type, and can't be manipulated directly; you must use our accessor functions to modify it.<br><br>AEGP_GetOutputModuleByIndex (<br>AEGP_RQItemRefH            rq_itemH,<br>A_long                    outmod_indexL,<br>AEGP_OutputModuleRefH   *outmodPH);  |
| AEGP_GetEmbedOptions              | Retrieves the embedding setting specified for the referenced AEGP_OutputModuleRefH.<br><br>AEGP_GetEmbedOptions (<br>AEGP_RQItemRefH            rq_itemH,<br>AEGP_OutputModuleRefH   outmodH,<br>AEGP_EmbeddingType       *embed_<br>↪optionsP);<br><br>AEGP_EmbeddingType will be one of the following: <ul style="list-style-type: none"> <li>• AEGP_Embedding_NOTHING</li> <li>• AEGP_Embedding_LINK</li> <li>• AEGP_Embedding_LINK_AND_COPY</li> </ul>                                |
| AEGP_SetEmbedOptions              | Specifies the embedding setting for the referenced AEGP_OutputModuleRefH.<br><br>AEGP_SetEmbedOptions (<br>AEGP_RQItemRefH            rq_itemH,<br>AEGP_OutputModuleRefH   outmodH,<br>AEGP_EmbeddingType       embed_options);   |
| AEGP_GetPostRenderAction          | Retrieves the post-render action setting for the referenced AEGP_OutputModuleRefH.<br><br>AEGP_GetPostRenderAction (<br>AEGP_RQItemRefH            rq_itemH,<br>AEGP_OutputModuleRefH   outmodH,<br>AEGP_PostRenderAction   *actionP);<br><br>AEGP_PostRenderAction will be one of the following: <ul style="list-style-type: none"> <li>• AEGP_PostRenderOptions_IMPORT</li> <li>• AEGP_PostRenderOptions_IMPORT_AND_REPLACE_USAG</li> <li>• AEGP_PostRenderOptions_SET_PROXY</li> </ul> |
| AEGP_SetPostRenderAction          | Specifies the post-render action setting for the referenced AEGP_OutputModuleRefH.<br><br>AEGP_SetPostRenderAction (<br>AEGP_RQItemRefH            rq_itemH,<br>AEGP_OutputModuleRefH   outmodH,<br>AEGP_PostRenderAction   action);  |
| AEGP_GetEnabledOutputs            | Retrieves which output types are enabled for the referenced AEGP_OutputModuleRefH.<br><br>AEGP_GetEnabledOutputs (<br>AEGP_RQItemRefH            rq_itemH,<br>AEGP_OutputModuleRefH   outmodH,<br>AEGP_OutputTypes       *typesP);  |
| <b>64.41. Output Module Suite</b> | <b>321</b><br>AEGP_OutputTypes will contain one or both of the following values: <ul style="list-style-type: none"> <li>• AEGP_OutputType_VIDEO</li> </ul>  |

---

## 64.42 Working With Effects

These functions provide a way for effects (and AEGPs) to obtain information about the context of an applied effect.

---

**Note:** Any time you modify or rely on data from outside the normal render pipeline, you run the risk of dependency problems.

There is no way for After Effects to know that you depend on this external information; consequently, you will not be notified if it changes out from under you.

---

## 64.42.1 AEGP\_PFIInterfaceSuite1

| Function                     | Purpose  |
|------------------------------|--|
| AEGP_GetEffectLayer          | <p>Obtain the layer handle of the layer to which the effect is applied.</p> <pre>AEGP_GetEffectLayer (   PF_ProgPtr  effect_ref,   AEGP_LayerH *layerPH);</pre>  |
| AEGP_GetNewEffectForEffect   | <p>Obtain the AEGP_EffectRefH corresponding to the effect.</p> <pre>AEGP_GetNewEffectForEffect (   AEGP_PluginID  aegp_plugin_id,   PF_ProgPtr     effect_ref,   AEGP_EffectRefH *effectPH);</pre>   |
| AEGP_ConvertEffectToCompTime | <p>Retrieve the composition time corresponding to the effect's layer time.</p> <pre>AEGP_ConvertEffectToCompTime (   PF_ProgPtr  effect_ref,   long        what_timeL,   unsigned long time_scaleLu,   A_Time      *comp_timePT);</pre>  |
| AEGP_GetEffectCamera         | <p>Obtain the camera (if any) being used by After Effects to view the effect's layer.</p> <pre>AEGP_GetEffectCamera (   PF_ProgPtr  effect_ref,   const A_Time *comp_timePT,   AEGP_LayerH camera_layerPH);</pre>  |
| AEGP_GetEffectCameraMatrix   | <p>Obtain the transform used to move between the layer's coordinate space and that of the containing composition.</p> <pre>AEGP_GetEffectCameraMatrix (   PF_ProgPtr  effect_ref,   const A_Time *comp_timePT,   A_Matrix4   *camera_matrixP,   A_FpLong    *dst_to_planePF,   A_short     *plane_widthPL,   A_short     *plane_heightPL);</pre> <p>NOTE: In cases where the effect's input layer has square pixels, but is in a non-square pixel composition, you must correct for the pixel aspect ratio by premultiplying the matrix by (1/parF, 1, 1).</p> |

## 64.42.2 AEGP\_GetEffectCameraMatrix Notes

The model view for the camera matrix is inverse of the matrix obtained from AEGP\_GetEffectCameraMatrix().

Also note that our matrix is row-based; OpenGL's is column-based.

## 64.43 Do This Many Times

Utilizes multiple processors (if available) for your computations.

### 64.43.1 AEGP\_IterateSuite1

| Function                         | Purpose  |
|----------------------------------|--|
| <code>AEGP_GetNumThreads</code>  | Ask After Effects how many threads are currently available.<br><br><pre>AEGP_GetNumThreads(<br/>  A_long  *num_threadsPL);</pre>   |
| <code>AEGP_IterateGeneric</code> | Specify a function for After Effects to manage on multiple processors. Can be any function pointer specified by <code>fn_func</code> , taking the arguments listed below. See <i>Private Data</i> for a description of how <code>refconPV</code> is used.<br><br><pre>AEGP_IterateGeneric(<br/>  A_long  iterationsL,<br/>  void    *refconPV,<br/>  A_Err   (*fn_func)<br/>    (void  *refconPV,<br/>     A_long thread_indexL,<br/>     A_long i,<br/>     A_long iterationsL));</pre> |

---

## 64.44 File Import Manager Suite

The FIMSuite allows file types handled by AEGPs to appear as part of the After Effects import dialog, and drag-and-drop messaging.

These are not for use by AEIOs! Rather, they are for importing projects which are best represented as After Effects compositions.

## 64.44.1 AEGP\_FIMSuite3

| Function                                 | Purpose  |
|--|--|
| AEGP_RegisterImportFlavor                | <p>Registers the name of the file type(s) supported by the plug-in. Upon return, <code>imp_refP</code> will be a valid opaque reference, or <code>AE_FIM_ImportFlavorRef_NONE</code>.</p> <pre>AEGP_RegisterImportFlavor(     const char          *nameZ,     AE_FIM_ImportFlavorRef *imp_refP);</pre>   |
| AEGP_RegisterImportFlavorFileTypes       | <p>Registers an array of file types and file extensions (the two arrays need not be of equal length) supported by the AEGP.</p> <pre>AEGP_RegisterImportFlavorFileTypes(     AE_FIM_ImportFlavorRef  imp_ref,     long                    num_filekindsL,     const AEIO_FileKind     *kindsAP,     long                    num_fileextsL,     const AEIO_FileKind     *extsAP);</pre> |
| AEGP_RegisterImportFlavorImportCallbacks | <p>Register the AEGP functions which will respond to import of different filetypes.</p> <pre>AEGP_RegisterImportFlavorImportCallbacks(     AE_FIM_ImportFlavorRef      ref,     AE_FIM_ImportFlags          single_     ↪flag,     const AE_FIM_ImportCallbacks *imp_     ↪cbsP);</pre>  |
| AEGP_SetImportedItem                     | <p>Designates an item as having been imported (possibly replacing an existing item), and sets associated import options.</p> <pre>AEGP_SetImportedItem(     AE_FIM_ImportOptions  imp_options,     AEGP_ItemH            imported_itemH);</pre>  |

---

## Cheating Effect Usage of AEGP Suites

---

As soon as we showed developers the initial implementation of AEGP suites, they wanted to “cheat” and use them from within effects. This is certainly possible, but please keep in mind that depending on factors outside the effect API (i.e., any information you get from the AEGP APIs) can lead to trouble. If After Effects thinks an effect has all the information it needs to render, it won’t (for example) update its parameters based on changes made through an AEGP function. We’re actively working on this dependency issue for future versions, but bear it in mind as you write effects which “masquerade” as AEGPs.

Effects can use some AEGP suites to take advantage of camera and lighting information, as well as the `AEGP_GetLayerParentComp` and `AEGP_GetCompBGColor` functions, from *AEGP\_CompSuite11*. This should not be interpreted to mean that effects can use *any* AEGP suite calls. Also, see *Effect UI & Events* for more information on effects adding keyframes.

*AEGP\_PFIInterfaceSuite* is the starting point. The functions in this suite allow you to retrieve the `AEGP_LayerH` for the layer to which the effect is applied, and the `AEGP_EffectRefH` for the instance of your effect. `AEGP_RegisterWithAEGP` from *AEGP\_UtilitySuite6* allows you to get an `AEGP_PluginID`, which is needed for many AEGP calls.

---

### 65.1 Depending on AEGP Queries

One word: Don’t. Effects cannot allow the results of AEGP queries to control what is rendered, without appropriately storing those query results (usually in sequence data), cancelling their own render, and forcing a re-render using the queried information.

This is tricky.

Failure to do so will result in nasty, subtle caching bugs guaranteed to cause hair loss and weight gain.

### 66.1 Have A Cookie

In cases where After Effects must preserve state information around the functions your AEGP calls (as when an artisan is rendering a frame, or a keyframer is adding and removing a series of keyframes from the same stream), you'll call `begin()` and `end()` functions.

Typically, the begin function will return an opaque identifier, or 'cookie', which you must then pass to the functions being used. The end function will properly dispose of the cookie. See `AEGP_StartAddKeyframes()` (under *AEGP\_KeyframeSuite3*) for an example.

---

### 66.2 Modifying Items In The Render Queue

If you call `AEGP_AddCompToRenderQueue` (from *AEGP\_RenderQueueSuite1*), or if the user manually adds or removes a composition from the render queue, all references to render queue items are invalidated. Similarly, adding or removing output modules invalidates any such references for each render queue item.

---

### 66.3 Names And Solids

Solids have names in the After Effects UI, but not in their `PF_LayerDef` *PF\_EffectWorld* / *PF\_LayerDef*. Consequently, their names cannot be retrieved by `AEGP_GetItemName` (in *AEGP\_ItemSuite9*) or `AEGP_GetLayerName` (in *AEGP\_LayerSuite8*).

However, you can use the `ItemH` associated with them to `AEGP_GetItemName` (from *AEGP\_ItemSuite9*).

---

## 66.4 Reporting Errors And Problems

Use `AEGP_ItemSuite>AEGP_ReportInfo()` to report information to users, and identify your plug-in. AEIO plug-ins use the `msg_func` pointer contained in the `AEIO_BasicData` they're passed (with every function) instead.

---

## 66.5 Transforms: What Happens First?

After Effects computes rotation based on auto-orientation (towards path, or point of interest), then computes Orientation, then computes X, Y, and Z rotation.

---

## 66.6 Accessing Pixels From Effect Layer Parameters

Use `AEGP_GetNewStreamValue` (in `AEGP_StreamSuite5`) to get the layer's `layer_id`, then the new `AEGP_GetLayerFromLayerID` (in `AEGP_LayerSuite8`) to get the `AEGP_LayerH`.

---

**Note:** If you're considering developing an Artisan, please talk it over with us first.

---

The Artisan API exposes function hooks necessary for a plug-in to provide rendered output of 3D layers, taking over completely from After Effects (which still handles all rendering of 2D layers). There can be only one Artisan per composition, chosen from within the *Composition Settings > Advanced* dialog. Artisans render the 3D environment, asking After Effects for information about each element in the composition. As you might guess, this is a vast and tedious process. This API is not recommended for anyone without a strong need to override After Effects' 3D rendering.

Artisans may share information with effects written to communicate with them, but effects may not initiate this communication. Many of the suites used by Artisans require a rendering context which is generated only after all effects have been applied to the layer.

---

### 67.1 Interactive Artisans

These differ from standard artisans in that they handle all layers in a composition (not just those which the user has made 3D), and they will only ever be called for onscreen display, never for rendered final output (the rendering calls "fall through" to the default artisan).

---

## Artisan Data Types

---

Below are the data types most commonly used in the Artisan API.

---

### 68.1 Data Types Used In The Artisan API

| Type                                      | Describes   |
|---|---|
| AEGP_RenderLayerContextH                  | State information at the time of a render request, sent to an Artisan by After Effects. |
| PR_RenderContextH                         | A collection of settings defining what is to be rendered, and how.                      |
| AEGP_SoundDataH                           | The audio settings used for a given layer.  |
| AEGP_RenderReceiptH<br>AEGP_FrameReceiptH | Used by Artisans when rendering.  |
| AEGP_WorldH                               | A frame of pixels.  |
| AEGP_RenderOptionsH                       | The settings associated with a render queue item.                                       |

---

### 68.2 Horz? Vert?

After Effects' matrix is row based; OpenGL's is column based. This means more work for you. Yay, billable hours!

---

## 68.3 Implementation And Design

An Artisan is nearly an application unto itself. Because we realized early in the After Effects 5.0 that there are many ways to approach the problems inherent in 3D rendering; intersections and shading, for example.

We provided an API with which we and third parties (yes, we really do use our own APIs) could implement any 3D rendering scheme desired.

---

## 68.4 3D Compositing, Not Modeling

After Effects is *not* a 3D modeling application. Users work in a responsive mode, switching to higher quality only at for proofing or final output. Consider providing at least two quality modes, one for layout and another for final output. Be conscious of render time in low quality mode.

---

## 68.5 Registering An Artisan

An Artisan is an AEGP, and has a single entry point. Artisans must also register their own function entry points and have a special callback for this purpose. See `AEGP_RegisterArtisan()` from *AEGP\_RegisterSuites5*.

This tables shows the functions that Artisans can support as defined by `PR_ArtisanEntryPoints`: only `render_func` is required.

## 68.5.1 Artisan Entry Points

| <b>PR_ArtisanEntryPoints</b> |   |
|------------------------------|---|
| global_setup_func0           | <p>Called only once, right after GP_Main. The global data is common across all instances of the plug-in. If you allocate memory during Global Setup, you must free it during your global_setdown_func.</p> <pre>PR_GlobalSetupFunc (   const PR_InData      *in_dataP,   PR_GlobalContextH    global_contextH,   PR_GlobalDataH       *global_dataPH);</pre>                                  |
| global_setdown_func0         | <p>Dispose of any global data you allocated.</p> <pre>PR_GlobalSetdownFunc (   const PR_InData      *in_dataP,   PR_GlobalContextH    global_contextH,   PR_GlobalDataH       global_dataH);</pre>  |
| global_do_about_func0        | <p>Tell the world about yourself! Use in_dataP&gt;msg_func to display your dialog.</p> <pre>PR_GlobalDoAboutFunc (   const PR_InData      *in_dataP,   PR_GlobalContextH    global_contextH,   PR_GlobalDataH       global_dataH);</pre>  |
| setup_instance_func0         | <p>Allocate and instantiate any data specific to this instance of your Artisan.</p> <pre>PR_InstanceSetupFunc (   const PR_InData      *in_dataP,   PR_GlobalContextH    global_contextH,   PR_InstanceContextH  instance_contextH,   PR_GlobalDataH       global_dataH,   PR_InstanceFlags     flags,   PR_FlatHandle         flat_dataH0,   PR_InstanceDataH     *instance_dataPH);</pre>   |
| setdown_instance_func0       | <p>Deallocate and free any data specific to this instance of your Artisan.</p> <pre>PR_InstanceSetdownFunc (   const PR_InData      *in_dataP,   PR_GlobalContextH    global_contextH,   PR_InstanceContextH  instance_contextH,   PR_GlobalDataH       global_dataH,   PR_InstanceDataH     instance_dataH);</pre>   |
| flatten_instance_func0       | <p>Flatten your data in preparation to being written to disk. (making sure it's OS independent, if your Artisan is).</p> <pre>PR_FlattenInstanceFunc (   const PR_InData      *in_dataP,   PR_GlobalContextH    global_contextH,   PR_InstanceContextH  instance_contextH,   PR_GlobalDataH       global_dataH,   PR_InstanceDataH     instance_dataH,   PR_FlatHandle         *flatH);</pre> |

| <b>336</b>                   | <p><b>Chapter 68. Artisan Data Types</b></p> <pre>PR_DoInstanceDialogFunc (   const PR_InData      *in_dataP,   PR_GlobalContextH    global_contextH,</pre>   |

## 68.6 The World Is Your Canvas

`AEGP_RenderTexture()` supplies the raw pixels of a layer, untransformed, into an arbitrarily-sized buffer.

`AEGP_RenderLayer()` invokes the entire After Effects render pipeline, including transforms, masking, et cetera, providing the layer as it appears in its composition, in a composition-sized buffer.

If the layer being rendered is 3D, the default (Standard 3D) Artisan is invoked to perform any 3D geometrics.

Your Artisan can use this to render track matte layers, and apply them only in a strictly 2D sense, to the transformed 3D layer.

Before rendering, the Artisans that ship with After Effects apply an inverse transform to get square pixels, then re-apply the transform before display.

For example, if the pixel aspect ratio is 10/11 (DV NTSC), we multiply by 11/10 to get square pixels. We process and composite 3D layers, then re-divide to get back to the original pixel aspect ratio.

The following suite supplies the layers, compositions, texture and destination buffers. This is a vital suite for all artisans.

### 68.6.1 AEGP\_CanvasSuite8

---

**Note:** Functions below are for interactive artisans only.

---

| Function                              | Purpose  |
|---------------------------------------|--|
| AEGP_GetPlatformWindowRef             | <p>Retrieves the platform-specific window context into which to draw the given PR_RenderContextH.</p> <pre>AEGP_GetPlatformWindowRef (     const PR_RenderContextH contextH,     AEGP_PlatformWindowRef *window_refP);</pre>                                     |
| AEGP_GetViewportScale                 | <p>Retrieves the source-to-frame downsample factor for the given PR_RenderContextH.</p> <pre>AEGP_GetViewportScale (     const PR_RenderContextH contextH,     A_FpLong *scale_xPF,     A_FpLong *scale_yPF);</pre>  |
| AEGP_GetViewportOrigin                | <p>Retrieves to origin of the source, within the frame (necessary to translate between the two), for the given PR_RenderContextH.</p> <pre>AEGP_GetViewportOrigin (     const PR_RenderContextH contextH,     A_long *origin_xPL,     A_long *origin_yPL);</pre> |
| AEGP_GetViewportRect                  | <p>Retrieves the bounding rectangle for the area to be drawn, for the given PR_RenderContextH.</p> <pre>AEGP_GetViewportRect (     const PR_RenderContextH contextH,     A_LegacyRect *v_rectPR);</pre>  |
| AEGP_GetFallowColor                   | <p>Retrieves the color used for the fallow regions in the given PR_RenderContextH.</p> <pre>AEGP_GetFallowColor (     const PR_RenderContextH contextH,     PF_Pixel8 *fallow_     ↪colorP);</pre>   |
| AEGP_GetInteractiveCheckerboard       | <p>Retrieves whether or not the checkerboard is currently active for the given PR_RenderContextH.</p> <pre>AEGP_GetInteractiveCheckerboard (     const PR_RenderContextH contextH,     A_Boolean *cboard_onPB);</pre>  |
| AEGP_GetInteractiveCheckerboardColors | <p>Retrieves the colors used in the checkerboard.</p> <pre>AEGP_GetInteractiveCheckerboardColors (     const PR_RenderContextH contextH,     PF_Pixel *color1P,     PF_Pixel *color2P);</pre>  |
| AEGP_GetInteractiveCheckerboardSize   | <p>Retrieves the width and height of one checkerboard square.</p> <pre>AEGP_GetInteractiveCheckerboardSize (     const PR_RenderContextH contextH,     A_u_long *cbd_widthPLu,     A_u_long *cbd_     ↪heightPLu);</pre>   |
| AEGP_GetInteractiveCachedBuffer       | <p>Retrieves the cached AEGP_WorldH last used for the PR_RenderContextH.</p>   |
| 338                                   | <p style="text-align: right;"><b>Chapter 68. Artisan Data Types</b></p> <pre>AEGP_GetInteractiveCachedBuffer (     const PR_RenderContextH contextH,     AEGP_WorldH *buffer);</pre>   |

## 68.7 Convert Between Different Contexts

Convert between render and instance contexts, and manage global data specific to the artisan.

## 68.7.1 AEGP\_ArtisanUtilSuite1

| Function                                 | Purpose  |
|--|--|
| AEGP_GetGlobalContextFromInstanceContext | <p>Given an instance context, returns a handle to the global context.</p> <pre>AEGP_GetGlobalContextFromInstanceContext (   const PR_InstanceContextH  instance_   ↪ contextH,   PR_GlobalContextH          *global_   ↪ contextPH);</pre> |
| AEGP_GetInstanceContextFromRenderContext | <p>Given the render context, returns a handle to the instance context.</p> <pre>AEGP_GetInstanceContextFromRenderContext (   const PR_RenderContextH  render_   ↪ contextH,   PR_InstanceContextH      *instnc_   ↪ ctextPH);</pre>        |
| AEGP_GetInstanceContextFromQueryContext  | <p>Given a query context, returns a handle to the instance context.</p> <pre>AEGP_GetInstanceContextFromQueryContext (   const PR_QueryContextH  query_contextH,   PR_InstanceContextH      *instance_   ↪ contextPH);</pre>               |
| AEGP_GetGlobalData                       | <p>Given the global context, returns a handle to global data.</p> <pre>AEGP_GetGlobalData (   const PR_GlobalContextH  global_   ↪ contextH,   PR_GlobalDataH          *global_   ↪ dataPH);</pre>   |
| AEGP_GetInstanceData                     | <p>Given an instance context, return the associated instance data.</p> <pre>AEGP_GetInstanceData (   const PR_InstanceContextH  instance_   ↪ contextH,   PR_InstanceDataH          *instance_   ↪ dataPH);</pre>                          |
| AEGP_GetRenderData                       | <p>Given a render context, returns the associated render data.</p> <pre>AEGP_GetRenderData (   const PR_RenderContextH  render_   ↪ contextH,   PR_RenderDataH          *render_   ↪ dataPH);</pre>  |

## 68.8 Smile! Cameras

Obtains the camera geometry, including camera properties (type, lens, depth of field, focal distance, aperture, et cetera).

### 68.8.1 AEGP\_CameraSuite2

| Function                                  | Purpose   |
|---|---|
| AEGP_GetCamera                            | <p>Given a layer handle and time, returns the current camera layer handle.</p> <pre>AEGP_GetCamera (   PR_RenderContextH  render_contextH,   const A_Time        *comp_timeP,   AEGP_LayerH        *camera_layerPH);</pre>  |
| AEGP_GetCameraType                        | <p>Given a layer, returns the camera type of the layer.</p> <pre>AEGP_GetCameraType (   AEGP_LayerH        aegp_layerH,   AEGP_CameraType    *camera_typeP;</pre> <p>The camera type can be the following:</p> <ul style="list-style-type: none"> <li>• AEGP_CameraType_NONE = -1</li> <li>• AEGP_CameraType_PERSPECTIVE</li> <li>• AEGP_CameraType_ORTHOGRAPHIC</li> </ul> |
| AEGP_GetDefaultCameraDistanceToImagePlane | <p>Given a composition handle, returns the camera distance to the image plane.</p> <pre>AEGP_GetDefaultCamera_ ↪DistanceToImagePlane (   AEGP_CompH        compH,   A_FpLong          *dist_to_planePF)</pre>   |
| AEGP_GetCameraFilmSize                    | <p>Retrieves the size (and units used to measure that size) of the film used by the designated camera.</p> <pre>AEGP_GetCameraFilmSize (   AEGP_LayerH        camera_layerH,   AEGP_FilmSizeUnits *film_size_unitsP,   A_FpLong          *film_sizePF0);</pre>  |
| AEGP_SetCameraFilmSize                    | <p>Sets the size (and unites used to measure that size) of the film used by the designated camera.</p> <pre>AEGP_SetCameraFilmSize) (   AEGP_LayerH        camera_layerH,   AEGP_FilmSizeUnits film_size_units,   A_FpLong          *film_sizePF0);</pre>   |

## 68.9 Notes Regarding Camera Behavior

Camera orientation is in composition coordinates, and the rotations are in layer (the camera's layer) coordinates.

If the camera layer has a parent, the position is in a coordinate space relative to the parent.

---

## 68.10 Orthographic Camera Matrix

Internally, we use composition width and height to set the matrix described by the OpenGL specification as

```
glOrtho(-width/2, width/2, -height/2, height/2, -1, 100);
```

The orthographic matrix describes the projection. The position of the camera is described by another, scaled matrix. The inverse of the camera position matrix provides the “eye” coordinates.

---

## 68.11 Focus On Focal

Remember, focal length affects field of view; focal distance only affects depth of field.

---

## 68.12 Film Size

In the real world, film size is measured in millimeters. In After Effects, it’s measured in pixels. Multiply by 72 and divide by 25.4 to move from millimeters to pixels.

Field of view is more complex;

= 1/2 field of view

$\tan() = 1/2 \text{ composition height} / \text{focal length}$

$\text{focal length} = 2 \tan() / \text{composition height}$

---

## 68.13 Hit The Lights!

Get and set the type of lights in a composition.

### 68.13.1 AEGP\_LightSuite2

| Function          | Purpose  |
|-------------------|--|
| AEGP_GetLightType | <p>Retrieves the AEGP_LightType of the specified camera layer.</p> <pre>AEGP_GetLightType(   AEGP_LayerH    light_layerH,   AEGP_LightType *light_typeP);</pre> <p>AEGP_LightType will be one of the following:</p> <ul style="list-style-type: none"> <li>• AEGP_LightType_PARALLEL</li> <li>• AEGP_LightType_SPOT</li> <li>• AEGP_LightType_POINT</li> <li>• AEGP_LightType_AMBIENT</li> </ul> |
| AEGP_SetLightType | <p>Sets the AEGP_LightType for the specified camera layer.</p> <pre>AEGP_SetLightType(   AEGP_LayerH    light_layerH,   AEGP_LightType light_type);</pre>  |

### 68.13.2 Notes On Light Behavior

The formula for parallel lights is found in Foley and Van Dam's "Introduction to Computer Graphics" (ISBN 0-201-60921-5) as is the formula for point lights.

We use the half angle variant proposed by Jim Blinn instead.

Suppose we have a point on a layer and want to shade it with the light.

Let V be the unit vector from the layer point to the eye point. Let L be the unit vector to the light (in the parallel light case this is constant). Let H be  $(V+L)/2$  (normalized). Let N be the unit normal vector to the layer.

The amount of specular reflected light is  $S * \text{power}(H \text{ Dot } N, \text{shine})$ , where S is the specular coefficient.

## 68.14 How Should I Draw That?

After Effects relies upon Artisans to draw 3D layer handles. If your Artisan chooses not to respond to this call, the default Artisan will draw 3D layer handles for you. Querying transforms is important for optimization of After Effects' caching.

The coordinate system is positive x to right, positive y down, positive z into the screen. The origin is the upper left corner. Rotations are x then y then z. For matrices the translate is the bottom row, orientations are quaternions (which are applied first), then any x-y-z rotation after that. As a general rule, use orientation or rotation but not both. Also use rotations if you need control over angular velocity.

## 68.15 Query Transform Functions

These functions give artisans information about the transforms they'll need in order to correctly place layers within a composition and respond appropriately to the various queries After Effects will send to their `PR_QueryFunc` entry point function.

As that entry point is optional, so is your artisan's response to the queries; however, if you don't, your users may be disappointed that (while doing interactive preview drawing) all the camera and light indicators vanish, until they stop moving! Artisans are complex beasts; contact us if you have any questions.

## 68.15.1 AEGP\_QueryXformSuite2

| Function                        | Purpose  |
|---------------------------------|--|
| AEGP_QueryXformGetSrcType       | <p>Given a query context, returns transform source currently being modified.</p> <pre>AEGP_QueryXformGetSrcType (   PR_QueryContextH    query_contextH,   AEGP_QueryXformType *src_type);</pre> <p>The query context will be one of the following:</p> <ul style="list-style-type: none"> <li>• AEGP_Query_Xform_LAYER,</li> <li>• AEGP_Query_Xform_WORLD,</li> <li>• AEGP_Query_Xform_VIEW,</li> <li>• AEGP_Query_Xform_SCREEN</li> </ul> |
| AEGP_QueryXformGetDstType       | <p>Given a query context, returns the currently requested transform destination.</p> <pre>AEGP_QueryXformGetDstType (   PR_QueryContextH    query_contextH,   AEGP_QueryXformType *dst_type);</pre>  |
| AEGP_QueryXformGetLayer         | <p>Used if the source or destination type is a layer. Given a query context, returns the layer handle.</p> <pre>AEGP_QueryXformGetLayer (   PR_QueryContextH query_contextH,   AEGP_LayerH      *layerPH);</pre>   |
| AEGP_QueryXformGetComp          | <p>Given a query context, returns the current composition handle.</p> <pre>AEGP_QueryXformGetComp (   PR_QueryContextH query_contextH,   AEGP_CompH       *compPH);</pre>  |
| AEGP_QueryXformGetTransformTime | <p>Given a query context, returns the time of the transformation.</p> <pre>AEGP_QueryXformGetTransformTime (   PR_QueryContextH query_contextH,   A_Time           *time);</pre>   |
| AEGP_QueryXformGetViewTime      | <p>Given a query context, returns the time of the associated view.</p> <pre>AEGP_QueryXformGetViewTime (   PR_QueryContextH query_contextH,   A_Time           *time);</pre>   |
| AEGP_QueryXformGetCamera        | <p>Given a query context, returns the current camera layer handle.</p> <pre>AEGP_QueryXformGetCamera (   PR_QueryContextH query_contextH,   AEGP_LayerH      *camera_layerPH);</pre>   |
| AEGP_QueryXformGetXform         | <p>Given a query context, returns the current matrix transform.</p> <pre>AEGP_QueryXformGetXform (   PR_QueryContextH query_contextH,   A_Matrix4        *xform);</pre>  |
| AEGP_QueryXformSetXform         | <p>Given a query context, return the matrix transform you compute in xform.</p> <pre>AEGP_QueryXformSetXform (   PR_QueryContextH query_contextH,   A_Matrix4        *xform);</pre>  |

## 68.16 Interactive Drawing Functions

We've added the ability for artisans to provide functions After Effects can use to do basic drawing functions for updating the comp window display during preview, including camera, light, and wireframe preview modeling.

### 68.16.1 PR\_InteractiveDrawProcs

| Function              | Purpose   |
|-----------------------|---|
| PR_Draw_MoveToFunc    | <pre>PR_Draw_MoveToFunc (   short x,   short y);</pre>          |
| PR_Draw_LineToFunc    | <pre>PR_Draw_LineToFunc (   short x,   short y);</pre>          |
| PR_Draw_ForeColorFunc | <pre>PR_Draw_ForeColorFunc (   const A_Color *fore_color)</pre> |
| PR_Draw_FrameRectFunc | <pre>PR_Draw_FrameRectFunc (   const A_Rect *rectPR );</pre>    |
| PR_Draw_PaintRectFunc | <pre>PR_Draw_PaintRectFunc (   const A_Rect *rectPR );</pre>    |

## 68.17 Notes On Query Time Functions

`AEGP_QueryXformGetTransformTime()` and `AEGP_QueryXformGetViewTime()` are both necessary for an artisan to build a representation of the scene to render.

`AEGP_QueryXformGetTransformTime()` gets the time of the transform, which is then passed to `AEGP_GetCompShutterFrameRange()` from *AEGP\_CompSuite11*.

`AEGP_QueryXformGetViewTime()` gets the time of the view, which is used in calling `AEGP_GetLayerToWorldXformFromView()` from *AEGP\_LayerSuite8*.

AEIOs are AEGPs that perform media file import and/or export. AEIOs do everything for a file of a given type that After Effects (or the plug-ins which ship with After Effects) would normally do. On the import side, AEIOs can open existing files, manage file-specific interpretation options, and provide audio and frames from the file to After Effects in AEGP\_SoundWorld and PF\_EffectWorld format. Additionally, AEIOs can create files interactively, asking users for the settings they'd like instead of reading them from a file. On the export side, AEIOs can create and manage output options for render queue items, create output files and save frames (provided by After Effects as PF\_EffectWorlds) into those files.

AEIOs work with uncompressed video with pixels in ARGB order from low to high-byte. Pixels can be 8-bit, 16-bit, or 32-bit float per channel. AEIOs must handle their own compression/decompression of any codecs supported.

---

## 69.1 AEIO, or AEGP?

AEIOs provide pixels and audio data to After Effects.

If you're writing an importer/exporter for a file format that represents timeline or project format (referencing file formats supported by After Effects or other installed AEIOs), write an AEGP and add its command to the Import/Export submenu.

---

## 69.2 AEIO For Import, Or MediaCore Importer?

After Effects supports MediaCore importer plug-ins. MediaCore is a set of shared libraries that grew out of Premiere Pro; thus the MediaCore APIs are described in the [Premiere Pro SDK](#).

Only MediaCore importer plug-ins support an importer priority system: The highest priority importer gets the first opportunity to import a file, and if the particular imported file isn't supported, the next-highest priority importer will then have the opportunity to try importing it, and so on. MediaCore importers cannot defer file import to an AEIO. So

if your goal is to take over file handling for any file type for which After Effects already provides a plug-in, you need to develop a MediaCore importer plug-in.

On the other hand, only AEIOs can display a setup dialog in the Interpret Footage < Main > More Options dialog.

If the above constraints haven't already answered whether you need to build an AEIO or MediaCore importer, then you'll likely want to build a MediaCore importer, which can be used across the video and audio applications including Premiere Pro, Media Encoder, Prelude, SpeedGrade, and Audition.

---

## 69.3 How It Works

From within its entry point function, an AEIO populates a structure of function pointers with the names of the functions it wants called in response to certain events. Many of these function hooks are optional.

---

## 69.4 What Would After Effects Do?

For many AEIO hook functions, you can ask After Effects to perform default processing (this capability is noted in each hook's descriptions).

Unless you have compelling reasons to do otherwise, return `AEIO_Err_USE_DFLT_CALLBACK` from the function, and let After Effects do the work.

This is also a good way to learn the calling sequence before beginning implementation.

---

## 69.5 Registering Your AEIO

During your plug-in's entry point function, populate a `AEIO_ModuleInfo` describing the filetype(s) the AEIO supports, and an `AEIO_FunctionBlock` structure that points to your file handling functions. For some of these functions, you can rely on After Effects' default behavior by returning `AEIO_Err_USE_DFLT_CALLBACK`. However, you must still provide a function matching the required signature, that does so. Once you've filled out both these structures, call `AEGP_RegisterIO()` from *AEGP\_RegisterSuites5*.

In the `AEIO_ModuleInfo` that you pass in to the register call, you provide the file type and description information that After Effects uses in the Import dialog, for the "Files of type" drop-down on Windows, or the Enable drop-down on MacOS. As of CS6, file extensions cannot be more than three characters long, even though we have a few built-in importers with longer extensions.

---

## 69.6 InSpec, OutSpec

On most import-related functions, an `AEIO_InSpecH` is passed. On most output-related functions, an `AEIO_OutSpecH` is passed.

What are these mysterious handles? These opaque data handles can be used with *AEGP\_IOInSuite5* and *AEGPIOOutSuite4*, to set or query for information about the import or output.

For example, on an import, you'll use `AEIO_InSpecH` when calling `AEGP_SetInSpecDimensions` in *AEGP\_IOInSuite*.

And during an export, you'll use `AEIO_OutSpecH` when calling `AEGP_GetOutSpecDimensions` in *AEGP\_IOOutSuite*. So use these handles to exchange information with After Effects about the details of the input or output.

---

## Calling Sequence

---

As with all AEGPs, the entry point function exported in the plug-in's PiPL is called during launch. During this function, the AEIO must provide function pointers to required functions and describe their capabilities, then pass the appropriate structures to *AEGP\_RegisterIO()*.

---

### 70.1 Import

When users select a file in the file import dialog which is of a type handled by your AEIO, its *AEIO\_VerifyFileImportable()* function will be called; it's called again for each such file the user imports. *AEIO\_InitInSpecFromFile()* will be called for each file; parse the file, and use the various set functions to describe it to After Effects. Also, construct any options data associated with the file, and save that data using *AEGP\_SetInSpecOptionsHandle()*.

After Effects then calls the plug-in's *AEIO\_GetInSpecInfo()* function, to get descriptive text about the file for display in the project window. As noted in the description of this function, it may be called for folders as well; we recommend that, if there is no valid options data for the file, you do nothing and return no error (that's what our AEIOs do).

*AEIO\_CountUserData()* is then sent; if the AEIO indicates that there is user data present, *AEIO\_GetUserData()* will follow. After Effects will then request that the plug-in draw a frame of video (for the project window thumbnail) by sending *AEIO\_DrawSparseFrame()*.

Once the supported file is added to a composition, user interaction will generate calls to *AEIO\_DrawSparseFrame()* and *AEIO\_GetSound()*.

When the project is saved, and if there is options data associated with the AEIO\_InSpec, After Effects will send *AEIO\_FlattenOptions()* during which the AEIO parses the options data, and creates a representation of it that contains no references to external memory. Likewise, the presence of any AEIO\_OutSpec options data will result in *AEIO\_GetFlatOutputOptions()* being sent.

---

## 70.2 Export

If the user adds an item to the render queue and chooses the AEIO's supported output format, *AEIO\_InitOutputSpec()* will be sent. Use the various get functions to obtain information about the output settings, and store any pertinent information using *AEIO\_SetOutputSpecOptionsHandle()*, followed by *AEIO\_GetFlatOutputOptions()*. *AEIO\_GetDepths()* is sent so After Effects can determine what output pixel bit depths the AEIO supports. *AEIO\_GetOutputInfo()* is sent so that file name, type and subtype information can be displayed in the output module details.

When the user clicks on the Format Options button, in the render queue, *AEIO\_UserOptionsDialog()* is called.

When the user actually clicks on the "Render" button, *AEIO\_SetOutputFile()* will be called, followed by *AEIO\_GetSizes()* (your AEIO is responsible for determining whether the destination has sufficient disk space available).

Before the video frames are sent, *AEIO\_StartAdding()* is sent for the AEIO to open the file handle and write out the file header. If the AEIO supports a video or audio format, *AEIO\_AddSoundChunk()* is sent for each audio chunk, and an *AEIO\_AddFrame()* for each video frame.

If the AEIO supports sequences of still images, *AEIO\_OutputFrame()* is called repeatedly. After Effects sends a *PF\_EffectWorld* representation of the frame to be output.

*AEIO\_WriteLabels()* is called (for each frame) to give the plug-in a chance to write out field and alpha interpretation information. *AEIO\_EndAdding()* is sent when there are no more frames (or audio) to be output. Close the output file.

## AEIO\_ModuleInfo

This is the structure where your AEIO will define its basic properties.

Notice that, in addition to describing the filetypes and extensions supported by your AEIO, you also describe your signature and behavior using the AEIO\_ModuleFlags. We love flags.

### 71.1 AEIO\_ModuleInfo Members

| Member                  | Purpose  |
|-------------------------|--|
| sig                     | A long, uniquely identifying your plug-in. Many developers prefer to use a decidedly Mac-ish four character code here. Please <a href="#">let us know</a> what sig you're using.   |
| name                    | Descriptive name for your AEIO plug-in.  |
| flags                   | Set of AEIO_ModuleFlags.   |
| flags2                  | Set of AEIO_ModuleFlags2.  |
| max_width<br>max_height | The maximum dimensions supported by your format.   |
| num_filetypes           | The number of filetypes supported by your AEIO.  |
| num_extensions          | The number of file extensions supported by your AEIO.  |
| num_clips               | The number of clipboard formats supported by your AEIO.  |
| create_mac              | The macOS four character code for files created by your AEIO.  |
| create_ext              | The file extension for files created by your AEIO.   |
| read_kinds              | This array of 16 AEIO_FileKinds need not be entirely filled out, but the first [num_filetypes + num_extensions + num_clips] ones must be populated, in that order.   |
| num_aux_exts            | The number of auxiliary extensions supported by your AEIO.<br>Say, for example, that you're writing an AEIO to import information from a 3D program that saves scene information into a .123 file, and camera information into a .xyz file.<br>The .xyz would be an auxiliary extension; it's not necessary to get the rest of the scene information, but it's associated with the .123 files. |
| aux_ext                 | The file extension of the auxiliary filetype(s) supported by your AEIO.  |

## 71.2 Behavior Flags

AEIOs set these flags (like effect plug-ins use global outflags) in `AEIO_ModuleInfo.flags` to indicate their behavior to After Effects. Some flags are only relevant to input, and some are only relevant to output.

## 71.2.1 AEIO\_ModuleFlags

| Flag                          | Purpose   | I or O?  |
|-------------------------------|---|----------|
| AEIO_MFlag_INPUT              | AEIO is an input module.  | Input!   |
| AEIO_MFlag_OUTPUT             | AEIO is an output module (one plug-in can be both).   | Output!  |
| AEIO_MFlag_FILE               | Each clip imported directly corresponds to a file, somewhere.   | Both     |
| AEIO_MFlag_STILL              | Supports still images, not video.   | Output   |
| AEIO_MFlag_VIDEO              | Supports video images, not stills.  | Output   |
| AEIO_MFlag_AUDIO              | Supports audio.   | Output   |
| AEIO_MFlag_NO_TIME            | Time information isn't part of the file format.<br>This would be the case with numbered stills, with individual frames imported based on the composition's time settings.           | Input    |
| AEIO_MFlag_INTERACT           | A new input sequence necessitates user interaction.<br>This would be the case for a non-file-based input module.  | Input    |
| AEIO_MFlag_INTERACT           | A new output sequence necessitates user interaction.<br>This would be the case for a non-file-based output module.  | Output   |
| AEIO_MFlag_CANT_CLIP          | The AEIO's drawing functions cannot accept dimensions smaller than the requested dimensions.  | Input    |
| AEIO_MFlag_MUST_INTERACT      | The AEIO must display a dialog box, even if a valid options data handle is available.   | Output   |
| AEIO_MFlag_CANT_SOUND         | The AEIO requires that all video data be processed, then sound data (instead of interleaving the processing the video and audio).   | Output   |
| AEIO_MFlag_CAN_ADD            | The AEIO supports adding non-sequential frames.   | Output   |
| AEIO_MFlag_HOST_DEPTH_DIALOG  | The AEIO wants After Effects to display a bit-depth selection dialog.   | Input    |
| AEIO_MFlag_HOST_FRAME_DIALOG  | The AEIO wants After Effects to display a dialog requesting that the user specify a starting frame.   | Input    |
| AEIO_MFlag_NO_OPTIONS         | The AEIO does not accept output options.  | Output   |
| AEIO_MFlag_NO_PIXELS          | The AEIO's file format doesn't actually store pixels. Currently unused as of CS6.   | (unused) |
| AEIO_MFlag_SEQUENCE_OPTIONS   | The AEIO will adopt the sequence options of its parent if a folder is selected.   | Input    |
| AEIO_MFlag_INPUT_OPTIONS      | The AEIO has user options associated with each input sequence.<br>NOTE: the options information must be flat (not referring to any data contained in external pointers or handles). | Input    |
| AEIO_MFlag_HSF_AWARE          | The AEIO will provide horizontal scaling factor (pixel aspect ratio) information for each new sequence.<br>This prevents After Effects from guessing.                               | Input    |
| AEIO_MFlag_HAS_LAYERS         | The AEIO supports multiple layers in a single document.   | Input    |
| AEIO_MFlag_SCRAP              | The AEIO has a clipboard parsing component.   | Input    |
| AEIO_MFlag_NO_UI              | After Effects should display no UI for this module (do not combine this flag with AEIO_MFlag_HOST_DEPTH_DIALOG or AEIO_MFlag_HOST_FRAME_START_DIALOG)                               | Input    |
| AEIO_MFlag_SEQ_OPTIONS_DIALOG | The AEIO has sequence options accessible from the More Options button in the Interpret Footage dialog.  | Input    |
| AEIO_MFlag_HAS_AUX            | The file format supported by the AEIO has depth information, normals, or some other non-color information related to each pixel.  | Input    |
| AEIO_MFlag_HAS_METADATA       | The file format supported by the AEIO supports user-definable metadata.<br>If this flag is set, the embed pop up in the output module dialog will be enabled.                       | Output   |

## 71.2.2 AEIO\_ModuleFlags2

Gotta have dem flags...

| Flag                                      | Purpose  | I or O? |
|---|--|---------|
| AEIO_MFlag2_AUDIO_OPTIONS                 | The AEIO has an audio options dialog.  | Output  |
| AEIO_MFlag2_SEND_ADDMARKERS               | The AEIO wants to receive marker data before outputting video or audio (useful for MPEG streams).  | Output  |
| AEIO_MFlag2_CAN_DO_MARKERS                | The AEIO supports combined markers; URL flips, chapters, and comments.   | Output  |
| AEIO_MFlag2_CAN_DRAW_FLOAT                | The AEIO can draw into float (32-bpc) worlds.  | Input   |
| AEIO_MFlag2_CAN_DO_AUDIO32                | Supports 32-bit audio output.  | Output  |
| AEIO_MFlag2_SUPPORTS_ICC                  | Supports ICC profiles.   | Both    |
| AEIO_MFlag2_CAN_DO_MARKERS_CUEPOINTS      | The AEIO supports combined markers; URL flips, chapters, comments, and cue points.   | Output  |
| AEIO_MFlag2_SEND_ADDMARKERS_BEFORE_EXPORT | The AEIO wants to process markers before video during export.  | Output  |
| AEIO_MFlag2_USES_QUICKTIME_MUTEX          | On MacOS, prior to the host calling AEIO_AddFrame or AEIO_OutputFrame from <i>AEIO_FunctionBlock4</i> , it will lock the global QuickTime mutex. | Output  |

---

## New Kids On The Function Block

---

During its main entry point function, each AEIO plug-in must fill in an `AEIO_FunctionBlock`, providing pointers to the functions After Effects will call for different file-related tasks.

The table below shows which functions are needed for input, and which ones are needed for output. For a bare-bones implementation, start with the functions that are noted as “Required” in the right column. You can often invoke “best-case” behavior by having After Effects handle the call for you (by returning `AEIO_Err_USE_DFLT_CALLBACK`).

For a barebones AEIO for video input only, implement the following functions: `AEIO_InitInSpecFromFile` or `AEIO_InitInSpecInteractive` (depending on whether the source is a file or interactively generated), `AEIO_DisposeInSpec`, `AEIO_GetInSpecInfo`, `AEIO_DrawSparseFrame`, `AEIO_CloseSourceFiles`, and `AEIO_InqNextFrameTime` (using `AEIO_Err_USE_DFLT_CALLBACK` is fine).

Starting from the IO sample, it is best to leave the other functions defined too, and fill them in further as needed.

---

### 72.1 AEIO\_FunctionBlock4

| Function                   | Response   | I or O? | Required?                              |
|----------------------------|--|---------|--|
| AEIO_InitInSpecFromFile    | <p>Given a file path, describe its contents to After Effects in the provided AEIO_InSpecH. Use all appropriate “set” calls from the <i>AEIO_IOInSuite</i>) to do so; if there is image data, set its depth, dimensions, and alpha interpretation. If there is audio, describe its channels and sample rate.</p> <p>The file path is a NULL-terminated UTF-16 string with platform separators.</p> <pre> AEIO_ ↳InitInSpecFromFile(   AEIO_BasicData  ↳   ↳ *basic_dataP,   const A_ ↳UTF16Char *file_ ↳pathZ,   AEIO_InSpecH  ↳   ↳ inH); </pre> | Input   | Yes, for file-based media              |
| AEIO_InitInSpecInteractive | <p>Using some form of user interaction (and not a file path provided by After Effects), describe the audio and video your generated AEIO_InSpecH contains.</p> <pre> AEIO_ ↳InitInSpecInteractive(   AEIO_BasicData  ↳   ↳ *basic_dataP,   AEIO_InSpecH  ↳   ↳ inH); </pre>  | Input   | Yes, for interactively generated media |
| AEIO_DisposeInSpec         | <p>Free an AEIO_InSpecH.</p> <pre> AEIO_DisposeInSpec(   AEIO_BasicData  ↳   ↳ *basic_dataP,   AEIO_InSpecH  ↳   ↳ inH); </pre>  | Input   | Yes                                    |

Table 1 – continued from previous page

| Function             | Response   | I or O? | Required? |
|----------------------|--|---------|-----------|
| AEIO_GetActiveExtent | <p>AEIO_Err_USE_DFLT_CALLBACK allowed. Populate the provided A_LRect with the active extent of the file's pixels at the given time.</p> <pre> AEIO_ ↪GetActiveExtent (   AEIO_BasicData ↪ ↪*basic_dataP,   AEIO_InSpecH ↪ ↪inH,   const A_Time ↪ ↪*tr,   A_LRect ↪ ↪*extent);                     </pre>   | Input   | Yes       |
| AEIO_GetInSpecInfo   | <p>Provide a few strings in AEIO_Verbiage to describe the file, which will appear in the Project panel. This includes the strings used to describe the file type and subtype (the codec).</p> <pre> AEIO_GetInSpecInfo (   AEIO_BasicData ↪ ↪*basic_dataP,   AEIO_InSpecH ↪ ↪inH,   AEIO_Verbiage ↪ ↪*verbiageP);                     </pre> <p>This function gets called OFTEN; every time we refresh the project panel. Keep allocations to a minimum. In the AEIOs that ship with After Effects, we check for a valid optionsH (using AEGP_GetInSpecOptionsHandle); if we find one, we use the information from within it. If not, we do nothing. This is important; if your AEIO handles still images, this function <i>will</i> get called for the folder containing the stills. Hopefully, there won't be an optionsH associated with it (unless you're writing a truly bizarre AEIO).</p> | Input   | Yes       |

## 72.2 What Goes In

These functions manage an input specification, After Effects' internal representation of data gathered from any source.

Any image or audio data in After Effects (except solids) is obtained from an input specification handle, or AEIO\_InSpecH.

### 72.2.1 AEGP\_IOInSuite5

| Function                    | Purpose  |
|-----------------------------|--|
| AEGP_GetInSpecOptionsHandle | Retrieves the options data (created by your AEIO) for the given AEIO_InSpecH.<br><br><pre>AEGP_GetInSpecOptionsHandle(     AEIO_InSpecH  inH,     void          **optionsPPV);</pre>   |
| AEGP_SetInSpecOptionsHandle | Sets the options data for the given AEIO_InSpecH. Must be allocated using the <i>Memory Suite</i> .<br><br><pre>AEGP_SetInSpecOptionsHandle(     AEIO_InSpecH  inH,     void          *optionsPV,     void          **old_optionsPPV);</pre>                     |
| AEGP_GetInSpecFilePath      | Retrieves the file path for the AEIO_InSpecH. The file path is a handle to a NULL-terminated A_UTF16Char string, and must be disposed with AEGP_FreeMemHandle.<br><br><pre>AEGP_GetInSpecFilePath(     AEIO_InSpecH  inH,     AEGP_MemHandle *file_nameZ);</pre> |
| AEGP_GetInSpecNativeFPS     | Retrieves the frame rate of the AEIO_InSpecH.<br><br><pre>AEGP_GetInSpecNativeFPS(     AEIO_InSpecH  inH,     A_Fixed       *native_fpsP);</pre>   |
| AEGP_SetInSpecNativeFPS     | Sets the frame rate of the AEIO_InSpecH.<br><br><pre>AEGP_SetInSpecNativeFPS(     AEIO_InSpecH  inH,     A_Fixed       native_fpsP);</pre>   |
| AEGP_GetInSpecDepth         | Retrieves the bit depth of the image data in the AEIO_InSpecH.<br><br><pre>AEGP_GetInSpecDepth(     AEIO_InSpecH  inH,     A_short       *depthPS);</pre>  |
| AEGP_SetInSpecDepth         | Indicates to After Effects the bit depth of the image data in the AEIO_InSpecH.<br><br><pre>AEGP_SetInSpecDepth(     AEIO_InSpecH  inH,     A_short       depthS);</pre>   |
| AEGP_GetInSpecSize          | Retrieves the size (in bytes) of the data referenced by the AEIO_InSpecH.<br><br><pre>AEGP_GetInSpecSize(     AEIO_InSpecH  inH,     AEIO_FileSize *sizePLLu);</pre>   |

Table 2 – continued from previous page

| Function                             | Purpose  |
|--------------------------------------|--|
| AEGP_ClearInSpecNativeStartTime      | <p>New in CC. Clear the native start time of the footage. Setting the native start time to 0 using AEGP_SetInSpecNativeStartTime doesn't do this. It still means there is a special native start time provided.</p> <pre>AEGP_ClearInSpecNativeStartTime(   AEIO_InSpecH inH);</pre> |
| AEGP_GetInSpecNativeDisplayDropFrame | <p>New in CC. Retrieve the drop-frame setting of the footage.</p> <pre>AEGP_GetInSpecNativeDisplayDropFrame(   AEIO_InSpecH inH,   A_Boolean *displayDropFrameBP);</pre>   |
| AEGP_SetInSpecNativeDisplayDropFrame | <p>New in CC. Assign the drop-frame setting of the footage.</p> <pre>AEGP_SetInSpecNativeDisplayDropFrame(   AEIO_InSpecH inH,   A_Boolean displayDropFrameB);</pre>   |

## 72.3 What Goes Out

These functions manage all interactions with an output specification in After Effects' render queue.

### 72.3.1 AEGPIOOutSuite4

| Function                     | Purpose  |
|------------------------------|--|
| AEGP_GetOutSpecOptionsHandle | <p>Retrieves the Options for the AEIO_OutSpecH.</p> <pre>AEGP_GetOutSpecOptionsHandle(   AEIO_OutSpecH outH,   void **optionsPPV);</pre>                   |
| AEGP_SetOutSpecOptionsHandle | <p>Sets the Options for the AEIO_OutSpecH.</p> <pre>AEGP_SetOutSpecOptionsHandle(   AEIO_OutSpecH outH,   void *optionsPV,   void **old_optionsPPV);</pre> |

Table 3 – continued from previous page

| Function                              | Purpose  |
|---------------------------------------|--|
| AEGP_GetOutSpecIsMissing              | <p>Passes back TRUE if there is no AEIO_OutSpecH.</p> <pre>AEGP_GetOutSpecIsMissing (   AEIO_OutSpecH  outH,   A_Boolean      *missingPB);</pre>   |
| AEGP_GetOutSpecShouldEmbedICCPProfile | <p>Returns TRUE if the AEIO should embed a color profile in the output.</p> <pre>AEGP_GetOutSpecShouldEmbedICCPProfile (   AEIO_OutSpecH  outH,   A_Boolean      *embedPB);</pre>  |
| AEGP_GetNewOutSpecColorProfile        | <p>Returns an (opaque) ICC color profile for embedding in the AEIO's output. Must be disposed with AEGP_DisposeColorProfile.</p> <pre>AEGP_GetNewOutSpecColorProfile (   AEGP_PluginID      aegp_plugin_id,   AEIO_OutSpecH      outH,   AEGP_ColorProfileP *color_profilePP);</pre>   |
| AEGP_GetOutSpecOutputModule           | <p>Returns the AEGP_RQItemRefH and AEGP_OutputModuleRefH associated with the given AEIO_OutSpecH. Fails if the render queue item is not found, or if AEIO_OutSpecH is not a confirmed outH and is a copy, i.e. if the Output Module settings dialog is open and the user hasn't hit OK.</p> <pre>AEGP_GetOutSpecOutputModule (   AEIO_OutSpecH      outH,   AEGP_RQItemRefH    *rq_itemP,   AEGP_OutputModuleRefH *om_refP);</pre> |

### 73.1 Export Bit-Depth

In the Output Module Settings, the user can choose a Depth based on the options the AEIO declares support for in `AEIO_GetDepths()` from *AEIO\_FunctionBlock4*.

If a plug-in supports higher bit-depth exports, it should be able to handle these higher bit-depth `PF_EffectWorlds` passed in `AEIO_AddFrame()` or `AEIO_OutputFrame()`, even when the export setting is not set to the same depth.

The frame delivered to the AEIO, and the final output will not necessarily be the same depth.

You may get frames passed in the project bit-depth instead of the final output if After Effects thinks that will be higher quality.

---

### 73.2 User Data vs. Options

It's possible to use either user data allocations or options handles to store metadata about a file.

We use user data for information that's to be embedded in the file (presuming the file format supports such information); marker data, field labels, etc.

We use option handles for information about the file; output settings, dimensions, details of compression settings used.

---

## Premiere Pro & Other Hosts

---

Adobe Premiere Pro and Adobe Premiere Elements both support the After Effects effect API as described in chapters 2, 3, and 5.

They offer a thorough host implementation, some the key omissions being 3D-related calls (auxiliary channel information, cameras and lights), 16-bit and SmartFX support, and other utility functions provided by After Effects' AEGP API.

Both Premiere Pro and Premiere Elements set `PF_InData>appl_id` to 'PrMr'.

In this chapter, we will describe the AE API support in Premiere Pro, but generally the same support exists in corresponding versions of Premiere Elements.

If you need to distinguish between Premiere Pro and Premiere Elements, you may use the Premiere-specific App Info Suite, available from the [Premiere Pro SDK](#) headers.

| Application Versions                         | PF_InData><br>version.major | ver- | PF_InData><br>version.minor | ver- |
|--|-----------------------------|------|-----------------------------|------|
| Premiere Pro CC through Premiere Pro CC 2019 | 13                          |      | 4                           |      |
| Premiere Pro CS6                             | 13                          |      | 2                           |      |
| Premiere Pro CS5.5                           | 13                          |      | 1                           |      |
| Premiere Pro CS5, Premiere Elements 9        | 13                          |      | 0                           |      |
| Premiere Pro CS4, Premiere Elements 8        | 12                          |      | 5                           |      |
| Premiere Pro CS3, Premiere Elements 4 and 7  | 12                          |      | 4                           |      |
| Premiere Pro 2.0, Premiere Elements 3        | 12                          |      | 3                           |      |
| Premiere Pro 1.5, Premiere Elements 2        | 12                          |      | 2                           |      |
| Premiere Pro 1.0, Premiere Elements 1        | 12                          |      | 1                           |      |

Note that the versioning used by Premiere Pro and Premiere Elements does not mean that they support the same API features After Effects did at the same version. It is simply meant to distinguish from one version to the next.

## CHAPTER 75

---

### Plug-in Installation

---

Use the common plug-in folder as described here: *Where Installers Should Put Plug-ins*.

If you try to install an effect plug-in only to the Premiere Pro plug-ins directory, you will be surprised to find that your effect is not rendered when you export to disk through Adobe Media Encoder, an entirely separate application.

Oh, and you'll also miss out on project interchange and copy / paste between Premiere Pro and After Effects.

---

## Basic Host Differences

---

We've tried to provide robust compatibility for After Effects effect plug-ins in Premiere Pro.

There are underlying differences in the render pipeline that lead to differences, and we realize the API implementation may not be perfect.

Below is an overview of some differences the plug-in will encounter when running in Premiere Pro.

---

### 76.1 Time Values

Premiere Pro uses slightly different time values in `PF_InData`. For example in CS4:

Rendering in NTSC, `time_scale` is 60000, `time_step` is 1001, `field` gives field order (in After Effects, for field rendering, scale is 2997, step is 50, or for progressive rendering, scale is 2997, step is 100).

Rendering in PAL, `time_scale` is 50, `time_step` is 1, `field` gives field order (in After Effects, for field rendering, scale is 3200, step is 64, or for progressive rendering, scale is 3200, step is 128).

It's the ratio of time-related values that produces the time value, not specifically the `time_scale` value. It's possible Premiere Pro will use different `time_scales` in the future, so please don't hard code. Just be aware that it does not necessarily use the exact same values as After Effects.

---

### 76.2 Rendering Frames

Premiere is optimized for responsive editing. When scrubbing in the timeline, and changing effect parameters, Premiere will immediately request a low-quality render for immediate display, followed by a high-quality render. So the effect may receive two requests for the same effective time, one at a low resolution, low bit-depth, followed by one at full-resolution, full bit-depth. The resolution requested for each render will take into account the Playback and

Paused Resolution set in the Source and Program Monitors: The first request will be at the Playback Resolution, and the second request will be at the Paused Resolution.

Premiere will also perform speculative rendering, to render a set of frames ahead in the timeline, so that if/when the editor starts playback, the initial frames will be ready. This means that when repositioning the time needle, or when changing effect parameters, Premiere will ask the effect to render a set of frames ahead of the current time. If the frames have previously been rendered and cached, the effect will not see these render requests because the cached frames will be used.

When rendering frames in Premiere-native pixel formats, Premiere will send `PF_Cmd_RENDER` once for each field, rather than for each frame. The `PF_InData->field` will indicate which field is being rendered, the `PF_LayerDef->height` will be half of the frame height, and the `PF_LayerDef->rowbytes` will be double the normal value.

---

## 76.3 Render Order

Premiere Pro was built to provide real-time playback of footage with effects wherever possible. The render scheduling is much more aggressive and multithreaded rendering is a basic requirement. This is quite different than After Effects, where users are building layers upon layers of effects and more willing to wait for a RAM preview.

Multithreaded rendering in Premiere applies to AE effects too. When rendering an AE effect, the request from Premiere passes through a critical section which is used for all commands, except those relating to arbitrary data. The critical section prevents two threads from calling the same instance of the effect at the same time. However, Premiere creates multiple instances of the effect, which can be called concurrently from separate threads.

Therefore, an effect should not expect to receive render requests in order of increasing time. Also, effects should not depend on static, non-constant variables.

---

## 76.4 Frame Dimensions

Differences between source footage and the project/composition are handled differently.

For example, in CS4, when importing an NTSC clip in a PAL sequence, `PF_InData>width,height` are (598, 480) and `PF_InData->pixel_aspect_ratio` is (768, 702).

In AE, `width,height` are (720, 480) and `pixel_aspect_ratio` is (10, 11).

---

## 76.5 PF\_InData

Premiere Pro handles field rendering differently than After Effects. While field rendering, `PF_InData>field` gives the current field being rendered, ignoring whether or not `PF_OutFlag_PIX_INDEPENDENT` flag was set.

In Premiere Pro, effects receive the quality setting of the monitor window in `PF_InData>quality`. This differs from After Effects, where the source layer's quality setting is provided here.

---

## 76.6 Parameter UI

Premiere Pro does not honor the `PF_ParamFlag_START_COLLAPSED` flag. Parameters are always initialized with their twirlies collapsed, and cannot be automatically twirled open by parameter supervision.

Premiere Pro supports the macro `PF_ADD_FLOAT_EXPONENTIAL_SLIDER()`, which lets you define an exponent. Although this macro is newly added for the CC 2015 release 2 SDK, Premiere Pro has used this for some time in the Fast Color Corrector, in the Input Grey Level parameter. The exponent is used so that although the range is from 0.10 to 10, 1.0 is about in the middle of the slider. The exponent we used was 2.5. Typical values would be from 0.01 to 100.

Starting in CC 2015, effects will not be sent `PF_Cmd_UPDATE_PARAMS_UI` or `PF_Event_DRAW` when the time needle is moved and there are no keyframes, unless the effect sets `PF_OutFlag_NON_PARAM_VARY`. Effects such as those that draw histograms in the Effect Controls panel will need to be aware of this optimization.

## 76.7 Missing Suites

Many suites supported by After Effects are not implemented in the Premiere Pro host. In several cases, even if a suite is missing in Premiere Pro, an equivalent macro function is available. Here are a few examples:

| After Effects suite call                              | Premiere Pro equivalent function              |
|---|---|
| <code>WorldTransformSuite1()-&gt;copy()</code>        | <code>PF_COPY()</code>                        |
| <code>WorldTransformSuite1()-&gt;convolve()</code>    | <code>in_data-&gt;utils-&gt;convolve()</code> |
| <code>FillMatteSuite2()-&gt;fill()</code>             | <code>PF_FILL()</code>                        |
| <code>PF_PixelDataSuite1-&gt;get_pixel_data8()</code> | <code>PF_GET_PIXEL_DATA8()</code>             |

The sample projects demonstrate alternate ways of handling a missing suite, by checking for the host application and version. The Portable sample project demonstrates both host application and version checking.

## 76.8 A Special Suite for AE Effects Running in Premiere Pro

No AEGP calls are supported by Premiere Pro. However, there are some interesting parallels in the header `PrSDKAE-Support.h`. For example, you can use the Utility Suite in that header to get the frame rate or field type of the source footage, or to get the speed applied to the clip.

Note that other suites from the Premiere Pro SDK cannot be used in AE effects.

## CHAPTER 77

---

### Multithreading

---

You may have noticed this flag: `PF_OutFlag2_PPRO_DO_NOT_CLONE_SEQUENCE_DATA_FOR_RENDER`. We advise against setting this flag, as it has been found to cause parameter UI problems.

---

## Bigger Differences

---

As long as an effect only supports the basic ARGB\_8u pixel format supported by After Effects, Premiere Pro will try to imitate the After Effects hosting behavior and hide various differences because of the different render pipeline architecture. But if an effect wants to support additional pixel formats, such as 32-bit RGB, be prepared to handle further divergent behavior.

---

### 78.1 Pixel Formats

Premiere Pro provides function suites for declaring support for pixel formats other than the 8-bit RGB format used by After Effects - ARGB\_8u. These pixel formats include the Premiere Pro native 8-bit RGB format - BGRA\_8u, as well as YUV, 32-bit formats, and more. For a more detailed discussion of the various pixel formats, see the [Premiere Pro SDK Guide](#), chapter 3, in the section “Pixel Formats and Colorspaces”.

Use the PF Pixel Format Suite (defined in PrAESDKSupport.h) to register for *PF\_EffectWorld / PF\_LayerDef* in other pixel formats. Use the Premiere Pixel Format Suite (defined in the aptly-named PrSDKPixelFormatSuite.h) to get black and white values in those pixel formats.

After Effects functions such as PF\_BLEND() have not been enhanced to work with pixel formats beyond 8-bit RGB.

---

### 78.2 32-Bit Float Support

Premiere Pro does not support After Effects 16-bit rendering or SmartFX. For 32-bit rendering in Premiere Pro, you'll need to declare support for one of the 32-bit pixel formats (see previous section), and then implement 32-bit rendering for PF\_Cmd\_RENDER. You can support multiple render depths this way. See the SDK Noise sample project for an example.

Depending on the clip(s) to which an effect is applied, 32-bit processing is not always necessary to preserve the quality of the source input. But there are settings to force 32-bit rendering, to give effects processing finer granularity and more

headroom, if desired. Go to Settings>Sequence Settings> Video Previews>Maximum Bit Depth, to control previewing from the timeline. For export to file, use Export Settings>Video>Basic Settings>Render at Maximum Depth.

---

## 78.3 PF\_CHECKOUT\_PARAM and Pixel Formats

Before CS6, PF\_CHECKOUT\_PARAM() only returned 8-bit ARGB buffers, regardless of the pixel format currently being used for rendering. Starting in CS6, an effect can opt in to get frames in the same format as the render request, whether it is 32-bit float, YUV, etc.

Plug-ins may request this behavior, but existing plug-ins will continue working receiving 8-bit ARGB frames. The call is `EffectWantsCheckedOutFramesToMatch RenderPixelFormat()`, in the PF Utility Suite, defined in `PrSDKAE-Support.h`. The call should be made on `PF_Cmd_GLOBAL_SETUP`, the same selector where an effect would already advertise support beyond 8-bit RGB using `AddSupportedPixelFormat()`.

---

### Plug-Ins... Reloaded

---

On its first launch, Premiere Pro loads all the plug-ins, reads the PiPL, and sends `PF_Cmd_GLOBAL_SETUP` to determine the plug-ins' capabilities. To save time on future application launches, it saves some of these capabilities in what we call the plug-in cache (the registry on Windows, a Property List file on macOS). The next time the application is launched, the cached information is used wherever possible, rather than loading the plug-ins.

When debugging, you can always force a reload of all the plug-ins by holding down the Shift key when launching Premiere Pro.

If your effect needs to be reloaded each time, there is a way to disable this caching. The plug-in can use the PF Cache On Load Suite in `AE_CacheOnLoadSuite.h` (from the [Premiere Pro SDK](#) headers) to call `PF_SetNoCacheOnLoad()` during `PF_Cmd_GLOBAL_SETUP`. For the second parameter of that function, pass a non-zero value if you want your effect to show up in the UI. Pass zero if loading failed, but you still want Premiere Pro to attempt to load it again on the next relaunch.

---

Premiere Pro uses a different preset scheme than After Effects.

From the Premiere Pro SDK Guide:

Effect presets appear in the Presets bin in the Effects panel, and can be applied just like Effects with specific parameter settings and keyframes. Effect presets can be created as follows:

- 1) Apply a filter to a clip
- 2) Set the parameters of the filter, adding keyframes if desired
- 3) Right-click on the filter name in the Effect Controls panel, and select “Save Preset..”
- 4) Create preset bins if desired by right-clicking in the Effects panel and choosing “New Presets Bin”
- 5) Organize the presets in the preset folders
- 6) Select the bins and/or presets you wish to export, right-click, and choose “Export Preset”

Presets should be installed in the Plug-ins directory. Once they are installed in that directory, they will be read-only, and the user will not be able to move them to a different folder or change their names. User-created presets will be modifiable.

On Windows Vista, these are in the user’s hidden AppData folder (e.g. C:\Users[user name]\AppData\Roaming\Adobe\Premiere Pro\[version]\Effect Presets and Custom Items.prfpset).

On macOS, they are in the user folder, at ~/Library/ Application Support/Adobe/Premiere Pro/[version]/Effect Presets and Custom Items.prfpset.

---

---

### Custom ECW UI Over A Standard Data Type

---

While this is logged as bug #1235407, there is a simple workaround: Create two separate parameters, and have the custom UI control the slider param using parameter supervision.

---

### Premiere Elements

---

Premiere Elements (but not Premiere Pro) displays visual icons for each effect. You will need to provide icons for your effects, or else an empty black icon will be shown for your effects, or even worse behavior in Premiere Elements 8.

The icons are 60x45 PNG files, and are placed here:

[Program Files]Adobe\Adobe Premiere Elements [version]\Plug-in\Common\Effect\Previews

The filename should be the match name of the effect, which you specify in the *PiPL Resources*, prefixed with “AE.” So if the match name was “MatchName”, then the filename should be “AE.MatchName.png”

---

## Unsupported Features

---

Premiere Pro is currently known to not support the following features of the After Effects API:

(If you would like a feature with a “-” bullet, please email [Premiere Pro API Engineering](#) with the feature request. Numbers preceded by an ‘F’ are feature request numbers, and the others are bug numbers)

- F7233 - extent\_hint support
- F7835 - Multiple PiPLs in a single plug-in
- F7836 - AEGP support
- F7517 - Audio support - if a plug-in sets PF\_OutFlag\_I\_USE\_AUDIO in PF\_Cmd\_GLOBAL\_SETUP, it will not be loaded at all
- F9355 - Support PF\_ParamFlag\_COLLAPSE\_TWIRLY
- PF World Transform Suite
- PF AE Channel Suite
- AE’s implementation of high bit color depth support
- SmartFX
- 3D support
- PF\_SUBPIXEL\_SAMPLE(), PF\_GET\_PIXEL\_DATA16()

---

### 83.1 But... Why’d You LOAD It If You Can’t RUN It?!

Premiere Pro attempts to load AEGP plug-ins. To detect this and avoid any problem behavior, your command hook function can access a suite which is only provided by After Effects; AEGP\_CanvasSuite is a fine candidate.

If the suite isn’t present, return an error. The plug-in will be placed on Premiere Pro’s “don’t load these” list.

For third-party hosts, the Adobe policy remains:

*“Adobe neither supports nor recommends the creation of Adobe-compatible third-party hosts. While it may be possible to create a partially functional host by reverse engineering from the plug-in API specification, we do not recommend it and will not support you in doing so.”*

---

### 84.1 Reality Sandwich

We realize that, for developers like you, one good way to grow your market is to ensure that your plug-ins work in as many hosts as possible.

Our SmartFX API has created quite a bit of distance between the After Effects API and the implementations available in the rest of the plug-in hosting world.

We will do what we can to help the other hosts support newer features. If you encounter problems in third party hosts, please refer them to us if they need assistance.
