<b>2</b>	<b>API Reference</b>	<b>3</b>
<b>3</b>	<b>Indices and tables</b>	<b>7</b>

gsocketpool is a simple connection pool for gevent.

## Basic Usage

The following is an example to create a connection pool that communicates an echo server running on *localhost 2000*.

```
>>> from gsocketpool import Pool
>>> from gsocketpool import TcpConnection
>>>
>>> options = dict(host='localhost', port=2000)
>>> pool = Pool(TcpConnection, options)
>>>
>>> with pool.connection() as conn:
...     conn.send('hello')
...     print conn.recv()
hello
```

## Implementing Protocol

Arbitrary protocols can be easily implemented by extending *Connection* class. You have to override at least three functions such as *open()*, *close()* and *is\_connected()*.

*TcpConnection* used in the above example is also implemented as a subclass of *Connection*.

```
class TcpConnection(Connection):
    def __init__(self, host, port, lifetime=600, timeout=None):
        self._sock = socket.socket(socket.AF_INET, socket.SOCK_STREAM)
        self._host = host
        self._port = port
```

```
self._lifetime = lifetime
self._timeout = timeout
self._connected = False
self._created = None

@property
def socket(self):
    return self._sock

def open(self):
    self._sock.connect((self._host, self._port))
    if self._timeout:
        self._sock.settimeout(self._timeout)

    self._connected = True
    self._created = time.time()

def close(self):
    if self._connected:
        self._sock.close()
        self._connected = False

def is_connected(self):
    return self._connected

def is_expired(self):
    if time.time() - self._created > self._lifetime:
        return True
    else:
        return False

def send(self, data):
    assert self._connected

    self._sock.send(data)

def recv(self, size=1024):
    assert self._connected

    return self._sock.recv(size)
```

For detailed usage, please refer to the [API reference](#).

**class** `gssocketpool.connection.Connection`

A base connection class.

Arbitrary connections can be defined by extending this class.

**close** ()

Closes the connection.

**get** ()

Returns the raw connection.

**is\_connected** ()

Returns whether the connection has been established.

**Return type** `bool`

**is\_expired** ()

Returns whether the connection is expired.

**Return type** `bool`

**open** ()

Opens a connection.

**reconnect** ()

Attempts to reconnect the connection.

**class** `gssocketpool.connection.TcpConnection` (*host, port, lifetime=600, timeout=None*)

A TCP connection.

**Parameters**

- **host** (*str*) – Hostname.
- **port** (*int*) – Port.
- **lifetime** (*int*) – Maximum lifetime (in seconds) of the connection.
- **timeout** (*int*) – Socket timeout.

```
class gsocketpool.pool.Pool(factory, options={}, initial_connections=0, max_connections=200,
                           reap_expired_connections=True, reap_interval=180)
```

Connection pool.

**Usage:** Communicating echo server running on localhost 2000:

```
>>>
>>> from gsocketpool import Pool
>>> from gsocketpool import TcpConnection
>>> options = dict(host='localhost', port=2000)
>>> pool = Pool(TcpConnection, options)
>>>
>>> with pool.connection() as conn:
...     conn.send('hello')
...     print conn.recv()
hello
```

### Parameters

- **factory** – *Connection* class or a callable that creates *Connection* instance.
- **options** (*dict*) – (optional) Options to pass to the factory.
- **initial\_connections** (*int*) – (optional) The number of connections that are initially established.
- **max\_connections** (*int*) – (optional) The maximum number of connections.
- **reap\_expired\_connections** (*bool*) – (optional) If set to True, a background thread (greenlet) that periodically kills expired connections will be launched.
- **reap\_interval** (*int*) – (optional) The interval to run to kill expired connections.

**acquire** (*retry=10, retried=0*)

Acquires a connection from the pool.

**Parameters** **retry** (*int*) – (optional) The maximum number of times to retry.

**Returns** *Connection* instance.

**Raises** *PoolExhaustedError*

**drop** (*conn*)

Removes the connection from the pool.

**Parameters** **conn** (*Connection*) – *Connection* instance.

**Raises** *ConnectionNotFoundError*

**drop\_expired** ()

Removes all expired connections from the pool.

**Parameters** **conn** (*Connection*) – *Connection* instance.

**release** (*conn*)

Releases the connection.

**Parameters** **conn** (*Connection*) – *Connection* instance.

**Raises** *ConnectionNotFoundError*

**size**

Returns the pool size.

```
class gsocketpool.exceptions.PoolExhaustedError
```

`class gsocketpool.exceptions.ConnectionNotFoundError`
