# CHAPTER 1

---

## Introduction

---

Redis is popular in-memory data structure store, used as a database, cache and message broker. [redis-py](#) is recommended Python client to Redis.

Intention of this documentation is to create examples how to use [redis-py](#).

## 2.1 Create status frequency graph from a log

**Task:** Read `/var/log/dpkg.log` and create a graph to visualize how often packages are installed, upgraded and removed.

**Solution:** The loop (30) call function `read_log` which reads the log line by line (13), splits the fields (14) and concatenate date `l[0]` and time `l[1]` in minutes (15). Third field of the log `l[2]` is status of the dpkg operation (install, upgrade, remove ...). `zincrby` (16) increments by 1 the score of `word` in the key `l[2]`. As a result the database contains keys (install, upgrade, remove ...) and associated lists of `words` sorted by score. Next loop (33) calls the function `write_csv` with all keys. As a result csv files are created in the current directory with the `word;score` pairs.

```

1  #!/usr/bin/python3
2  # Tested with python 3.6.3, python-redis 2.10.5 and redis 4.0.1
3
4  import redis
5
6  LOG_FILES = ['/var/log/dpkg.log', ]
7  LOG_SEPARATOR = ' '
8  CSV_SEPARATOR = ';' 
9
10 def read_log(log_file):
11     ''' This function reads log_file and put the status into the database '''
12     f = open(log_file, 'r')
13     for line in f:
14         l = line.split(LOG_SEPARATOR)
15         word = l[0] + ' ' + l[1][:3]
16         r.zincrby(l[2], word, 1)
17     f.close()
18
19 def write_csv(status):
20     ''' This function reads the database and writes the status CSV file '''
21     f = open(status.decode() + '.csv', 'w')
22     l = r.zrange(status, 0, -1, 'DESC', 'WITHSCORES')
23     for x in l:

```

(continues on next page)

(continued from previous page)

```

24     f.write(x[0].decode() + CSV_SEPARATOR + str(int(x[1])) + '\n')
25     f.close()
26
27 r = redis.StrictRedis(host='localhost', port=6379, db=0)
28 r.flushdb()
29
30 for log_file in LOG_FILES:
31     read_log(log_file)
32
33 for status in r.keys():
34     write_csv(status)

```

**Result:** The csv files can be used to create a graph with *gnuplot*.

## 2.2 List 10 most used words in a text

**Task:** Read text from a file and list 10 most frequently used words in it.

**Solution:** Let's use article about Redis at wikipedia.org as a text.

```

#!/bin/bash
lynx -dump -nolist https://en.wikipedia.org/wiki/Redis > redis.txt

```

To tokenize words from the text we use NLTK. NLTK data must be installed by `nltk.download()` (8) before `word_tokenize` (17) and `wordnet.synsets` (19) can be used. Complete NLTK data is over 3GB, hence the download is commented. `zincrby` (20) increments by 1 the score of `word` in the key `topchart` and `zrange` (23) returns top 10 words with scores.

```

1  #!/usr/bin/python3
2  # Tested with python 3.6.3, python-redis 2.10.5 and redis 4.0.1
3
4  import redis
5  import nltk
6  from nltk.corpus import wordnet
7  from nltk.tokenize import word_tokenize
8  # nltk.download()
9
10 file = 'redis.txt'
11
12 r = redis.StrictRedis(host='localhost', port=6379, db=0)
13 r.flushdb()
14
15 f = open(file, 'r')
16 text = f.read()
17 words = word_tokenize(text)
18 for word in words:
19     if wordnet.synsets(word):
20         r.zincrby("topchart", word, 1)
21 f.close()
22
23 ranking = r.zrange("topchart", 0, 10, 'DESC', 'WITHSCORES')
24 for x in ranking:
25     print(x[0].decode('utf-8') + ', ' + str(int(x[1])))

```

### Result:

```

> ./create-topchart.py
is,24
a,23
in,19
edit,13
Retrieved,11
by,10
database,9
Labs,9
are,8
on,7
data,7

```

## CHAPTER 3

---

### Indices and tables

---

- `genindex`
- `modindex`
- `search`
