smbus2 - A drop-in replacement for smbus-cffi/smbus-python

class `smbus2.SMBus` (*bus=None, force=False*)

block_process_call (*i2c_addr, register, data, force=None*)

Executes a SMBus Block Process Call, sending a variable-size data block and receiving another variable-size response

Parameters

- **i2c_addr** (*int*) – i2c address
- **register** (*int*) – Register to read/write to
- **data** (*list*) – List of bytes
- **force** (*Boolean*) –

Returns List of bytes

Return type list

close ()

Close the i2c connection.

enable_pec (*enable=True*)

Enable/Disable PEC (Packet Error Checking) - SMBus 1.1 and later

Parameters **enable** (*Boolean*) –

i2c_rdwr (**i2c_msgs*)

Combine a series of i2c read and write operations in a single transaction (with repeated start bits but no stop bits in between).

This method takes `i2c_msg` instances as input, which must be created first with `i2c_msg.read()` or `i2c_msg.write()`.

Parameters **i2c_msgs** (*i2c_msg*) – One or more `i2c_msg` class instances.

Return type `None`

open (*bus*)

Open a given i2c bus.

Parameters **bus** (*int or str*) – i2c bus number (e.g. 0 or 1) or an absolute file path (e.g. `‘/dev/i2c-42’`).

Raises **TypeError** – if `type(bus)` is not in (`int`, `str`)

pec

Get and set SMBus PEC. 0 = disabled (default), 1 = enabled.

process_call (*i2c_addr, register, value, force=None*)

Executes a SMBus Process Call, sending a 16-bit value and receiving a 16-bit response

Parameters

- **i2c_addr** (*int*) – i2c address
- **register** (*int*) – Register to read/write to
- **value** (*int*) – Word value to transmit

- **force** (*Boolean*) –

Return type *int*

read_block_data (*i2c_addr, register, force=None*)

Read a block of up to 32-bytes from a given register.

Parameters

- **i2c_addr** (*int*) – i2c address
- **register** (*int*) – Start register
- **force** (*Boolean*) –

Returns List of bytes

Return type *list*

read_byte (*i2c_addr, force=None*)

Read a single byte from a device.

Return type *int*

Parameters

- **i2c_addr** (*int*) – i2c address
- **force** (*Boolean*) –

Returns Read byte value

read_byte_data (*i2c_addr, register, force=None*)

Read a single byte from a designated register.

Parameters

- **i2c_addr** (*int*) – i2c address
- **register** (*int*) – Register to read
- **force** (*Boolean*) –

Returns Read byte value

Return type *int*

read_i2c_block_data (*i2c_addr, register, length, force=None*)

Read a block of byte data from a given register.

Parameters

- **i2c_addr** (*int*) – i2c address
- **register** (*int*) – Start register
- **length** (*int*) – Desired block length
- **force** (*Boolean*) –

Returns List of bytes

Return type *list*

read_word_data (*i2c_addr, register, force=None*)

Read a single word (2 bytes) from a given register.

Parameters

- **i2c_addr** (*int*) – i2c address

- **register** (*int*) – Register to read
- **force** (*Boolean*) –

Returns 2-byte word

Return type *int*

write_block_data (*i2c_addr, register, data, force=None*)

Write a block of byte data to a given register.

Parameters

- **i2c_addr** (*int*) – i2c address
- **register** (*int*) – Start register
- **data** (*list*) – List of bytes
- **force** (*Boolean*) –

Return type *None*

write_byte (*i2c_addr, value, force=None*)

Write a single byte to a device.

Parameters

- **i2c_addr** (*int*) – i2c address
- **value** (*int*) – value to write
- **force** (*Boolean*) –

write_byte_data (*i2c_addr, register, value, force=None*)

Write a byte to a given register.

Parameters

- **i2c_addr** (*int*) – i2c address
- **register** (*int*) – Register to write to
- **value** (*int*) – Byte value to transmit
- **force** (*Boolean*) –

Return type *None*

write_i2c_block_data (*i2c_addr, register, data, force=None*)

Write a block of byte data to a given register.

Parameters

- **i2c_addr** (*int*) – i2c address
- **register** (*int*) – Start register
- **data** (*list*) – List of bytes
- **force** (*Boolean*) –

Return type *None*

write_quick (*i2c_addr, force=None*)

Perform quick transaction. Throws IOError if unsuccessful. :param i2c_addr: i2c address :type i2c_addr: int :param force: :type force: Boolean

write_word_data (*i2c_addr*, *register*, *value*, *force=None*)

Write a byte to a given register.

Parameters

- **i2c_addr** (*int*) – i2c address
- **register** (*int*) – Register to write to
- **value** (*int*) – Word value to transmit
- **force** (*Boolean*) –

Return type *None*

class `smbus2.i2c_msg`

As defined in `i2c.h`.

addr

Structure/Union member

buf

Structure/Union member

flags

Structure/Union member

len

Structure/Union member

static read (*address*, *length*)

Prepares an i2c read transaction.

Parameters

- **address** – Slave address.
- **length** – Number of bytes to read.

Type *address*: int

Type *length*: int

Returns New *i2c_msg* instance for read operation.

Return type *i2c_msg*

static write (*address*, *buf*)

Prepares an i2c write transaction.

Parameters

- **address** (*int*) – Slave address.
- **buf** (*list*) – Bytes to write. Either list of values or str.

Returns New *i2c_msg* instance for write operation.

Return type *i2c_msg*
