Contents

1	User	3
2	Configuration	5

The web_user module provides facilities to manage external user accessing from the web.

CHAPTER 1

User

A user is uniquely identified by an email and he is authenticated using a hashed password. The user can be linked to a Party.

Two actions are available:

- The *Validate E-mail* which sent an e-mail to the user with a link to an URL that ensures the address exists.
- The *Reset Password* which sent an e-mail to the user with a link to an URL to set a new password.

The `web_user` module uses parameters from different sections:

- *web*:
 - *reset_password_url*: the URL to reset the password to which the parameters *email* and *token* will be added.
 - *email_validation_url*: the URL for email validation to which the parameter *token* will be added.
- *email*:
 - *from*: the origin address to send emails.
- *session*:
 - *web_timeout*: defines in seconds the validity of the web session. Default: 30 days.
 - *web_timeout_reset*: in seconds the validity of the reset password token. Default: 1 day.
